Kantronics no longer includes the host mode spec. in with the KAM Plus. I would guess that most people did not need it, and they saved some trees by not printing the extra info. I called up Kantronics and asked for information on host mode, and an VERY knowlegeable and friendly customer service rep photocopied the host mode information they have and sent it out to me. It

arrived within days.

The pages were from an older KAM manual, in the days when they DID have the host mode stuff in there.

Kantronics has a very good reputation of helping software developers. Call them up and ask them for what you need.

If CW/VOICE is so efficient, why does NTS highly suggest that msgs be limited
to 20 or 25 words or less. Compare that to length of many msgs/bulls on pkt.

Before the FCC 94-76

FEDERAL COMMUNICATIONS COMMISSION
Washington, D. C. 20554

In the Matter of) PR Docket No. 93-85
)
Amendment of Part 97 of the) RM-7649 RM-7669
Commission's Rules Concerning) RM-7675 RM-7676
Message Forwarding Systems in) RM-7681 RM-7904
the Amateur Service.)

REPORT AND ORDER

Adopted: March 30, 1994;
Released: April 12, 1994

By the Commission:

I. INTRODUCTION

1. On March 18, 1993, we adopted a Notice of Proposed Rule Making (Notice)[1] in the above-captioned proceeding. In the Notice, we proposed to relax the amateur service rules to enable contemporary message forwarding systems to operate at high speed while retaining safeguards to prevent misuse.[2] This Report and Order adopts the rules substantially as proposed and incorporates several minor modifications suggested in the comments.

II. DISCUSSION

2. Message forwarding systems have been a mainstream operating activity since the inception of the amateur service early in this century.[3] The development of digital technology now makes high volume, high speed communications systems practical. This development has resulted in thousands of amateur

operators voluntarily linking their individually-licensed very-

high frequency (VHF)[4] stations together to form easily-accessible ad hoc message forwarding systems.[5] Currently, the control operator of each station is held individually accountable for each message retransmitted. This introduces unnecessary message content review and resultant system delays. The objective of this proceeding, therefore, is to ascertain the accommodations that should be provided for amateur stations operated in contemporary high speed message forwarding systems to eliminate unnecessary oversight procedures. There were forty-two comments and two reply comments filed in response to the Notice.

3. The potential for transmitting a high volume of messages cannot be achieved because Section 97.103(a) of the Commission's Rules, 47 C.F.R. 97.103(a), holds each station licensee and control operator accountable for the proper operation of the station. This requires, in effect, the control operator of every forwarding station to review each message for improper content prior to its retransmission.[6] The proposed new rule section provided that the control operators of intermediate forwarding stations, other than the first forwarding station, would not be held accountable when their stations retransmitted improper communications inadvertently.[7] This approach would facilitate high speed message forwarding yet retain a degree of protection against abuse. We also proposed to restate the definition of the term "repeater" in Section 97.3 of the Commission's Rules, 47 C.F.R. 97.3, so as to preclude any confusion with the accommodations proposed for message forwarding systems.

4. The commenters generally support our approach. They agree with relieving the control operators of intermediate forwarding stations of the need to review every message.[8] Our proposal to retain the requirement for the control operator of the first forwarding station to be accountable for retransmitting improper communications, however, drew a mixed response. The American Radio Relay League, Inc., (League) states that the obligation of the control operator of the first forwarding station should be the establishment of the identity of the station originating the message. Only when this is not done should these control operators be held

accountable for improper message content.[9] Comments from some amateur operators, however, do not deem it necessary to hold any control operator of a forwarding station accountable for improper communications.[10] Another commenter recommends that the message format be regulated to assist in the identification of the originating station.[11]

5. There is no central supervisory authority in an ad hoc amateur service digital network. The vulnerability of an unsupervised system can make it an easy target for misuse by uncooperative operators and non-licensees. It can be difficult, moreover, to establish after the fact that a particular VHF station originated a fleeting high speed digital transmission. For these reasons, there must be on-going oversight of the system. The control operators of the first forwarding stations are in the best position to provide such oversight. They are the stations that accept, on behalf of the system, messages from originating stations.[12] We will, therefore, accept the League's recommendation. We are amending the rules substantially as proposed to hold accountable only the licensee of the station originating a message and the license of the first station forwarding a message in a high speed message forwarding system. The licensee of the first forwarding station must either authenticate the identity of the station from which it accepts communications on behalf of the system, or accept accountability for the content of the message.[13] The matter of message format, however, will be left with the designers of the systems. Since we believe our modification to the rule is sufficient to insure accountability for violative communications, we see no need to specify any particular message format. The League also requests that we clarify which station in a message forwarding system is the first forwarding station.[14] The answer is that it is the station that receives a communication directly from the originating station and introduces it into the message forwarding system.

6. The comments also agree generally that the accommodations for message forwarding systems should not apply to other operating activities such as repeaters and auxiliary stations.[15] The League and the Colorado Council of Amateur Radio Clubs (CCARC), among others, suggest that we substitute the word "simultaneously" for "instantaneously" in the redefinition of a repeater.[16] We concur with the comments and will adopt these modifications.

7. In summary, we have decided to amend the amateur service rules to accommodate message forwarding systems. We believe these rule changes will enable contemporary high speed message forwarding systems to operate as their designers intended, while retaining the minimum safeguards necessary to prevent misuse.

III. ORDERING CLAUSES

8. Accordingly, IT IS ORDERED that effective June 1, 1994, Part 97 of the Commission's Rules, 47 C.F.R. Part 97, IS AMENDED as set forth below. Authority for this action is found in Sections 4(f)(4)(A), (B), and (J), 4(i), and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. 154(f)(4)(A), (B),and (J), 154(i), and 303(r).

9. IT IS FURTHER ORDERED that this proceeding IS TERMINATED.

10. For further information, contact William T. Cross, Personal Radio Branch, (202) 632-4964.

FEDERAL COMMUNICATIONS COMMISSION

William F. Caton
Acting Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended as follows:

Part 97-Amateur Radio Service

1. The authority citation for Part 97 continues to read as follows:

Authority: 48 Stat. 1066, 1082, as amended; 47 U.S.C. 154, 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. 151-155, 301-609, unless otherwise noted.

2. Section 97.3 is amended by redesignating paragraphs (a)(28) through (a)(44) as paragraphs (a)(29) through (a)(45), respectively, adding a new paragraph (a)(28), and revising paragraph (a)(7) and redesignated paragraph (a)(36) to read as follows:

97.3 Definitions.

(a) ***

(7) Auxiliary station. An amateur station, other than in a message forwarding system, that is

transmitting communications point-to-point within a system of cooperating amateur stations.

* * * * *

(28) Message forwarding system. A group of amateur stations participating in a voluntary, cooperative, interactive arrangement where communications are sent from the control operator of an originating station to the control operator of one or more destination stations by one or more forwarding stations.

* * * * *

(36) Repeater. An amateur station that simultaneously retransmits the transmission of another amateur station on a different channel or channels.

* * * * *

3. Section 97.109(e) is revised to read as follows:

97.109 Station control.

* * * * *

(e) No station may be automatically controlled while transmitting third party communications, except a station participating as a forwarding station in a message forwarding system.

4. Section 97.205 is amended by adding new paragraph (g) to read as follows:

97.205 Repeater station.

* * * * *

(g) The control operator of a repeater that retransmits inadvertently communications that violate the rules in this Part is not accountable for the violative communications.

5. Section 97.216 is redesignated as Section 97.217.

6. Section 97.219 is added to read as follows:

97.219 Message forwarding system.

(a) Any amateur station may participate in a message forwarding system, subject to the privileges of the class of operator license held.

(b) For stations participating in a message forwarding system, the control operator of the station

originating a message is primarily accountable for any violation of the rules in this Part contained in the message.

(c) Except as noted in paragraph (d) of this section, for stations participating in a message forwarding system, the control operators of forwarding stations that retransmit inadvertently communications that violate the rules in this Part are not accountable for the violative communications. They are, however, responsible for discontinuing such communications once they become aware of their presence.

(d) For stations participating in a message forwarding system, the control operator of the first forwarding station must:

(1) Authenticate the identity of the station from which it accepts communications on behalf of the system; or

(2) Accept accountability for any violation of the rules in this Part contained in messages it retransmits to the system.

Footnotes

1. 8 FCC Rcd 2202 (1993).
2. See Notice at para. 2.
3. A message forwarding system is a group of amateur stations participating in a voluntary, cooperative, interactive arrangement where communications from the control operator of an originating station are transmitted to one or more destination stations via forwarding stations, which may or may not be automatically controlled.
4. The amateur service VHF bands are the 6 meter (50-54 MHz), 2 meter (144-146 MHz), and 1.25 meter (222-225 MHz) bands. See Section 97.301(a) of the Commission's Rules, 47 C.F.R. 97.301(a). Currently, the 2 meter band is the most popular band for digital message forwarding systems. The propagation characteristic of the 2 meter band generally is line-of-sight. Ad hoc systems comprised of thousands of VHF stations, however, blanket the United States and beyond.
5. The American Radio Relay League, Inc. AX.25 Amateur Packet-Radio Link-Layer Protocol, Version 2.0, October 1984, for example, is operated in systems at rates that produce a communication capability of several hundred characters per second.

6. Improper communications are communications prohibited by Section 97.113 of the Commission's Rules, 47 C.F.R. 97.113. This section recently has been revised to lessen restrictions on communications that amateur stations may transmit. See Report and Order, PR Docket No. 92-136, 8 FCC Rcd 5072 (1993).
7. Although control operators of forwarding stations other than the first forwarding station would no longer have to screen each message, they would be responsible for discontinuing communications that violate the rules once they become aware of their presence.
8. See, for example, comments of Gary R. Mitchell at 1, Lee S. Parr at 2.
9. Reply comments of the League at 4.
10. See, for example, comment of Charles L. Furlong at 1, James L. Reese at 1, Colorado Council of Amateur Radio Clubs at 1.
11. Comments of Alfred T. Yeager II at 1.
12. The American Radio Relay League Inc. AX.25 Amateur Packet-Radio Link-Layer Protocol, Version 2.0, October 1984, for example, incorporates provisions to record the trail of message forwarding stations for each message communicated.
13. We note that originator authentication techniques in the amateur service are under discussion. See, for example, Jon Bloom, Empirically Speaking, QEX ARRL Experimenter's Exchange 2 (November, 1993).
14. Comments of the League at 15.
15. See, for example, comments of Jay O'Brien at 1.
16. Comments of the League at 16, Colorado Council of Amateur Radio Clubs at 3.

1091. 9600 Baud Modifications?

1092. Announcing: TAPR Networking Mailing List, and Dayton Network Meeting

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-15 16:34:17 UTC
From: jra@lawdept.daytonOH.ncr.com
Message-ID: <jra.100.000B92A4@lawdept.daytonOH.ncr.com>
Source record: 49587

At its annual meeting in March, TAPR formed (among others) a special interest group devoted to topics of regional networking in packet radio. At the SIG meeting, everyone decided it would be a Good Thing to create a mailing list to help with communications on this topic.

So, the TAPR Regional Networking SIG mailing list was born, and it's now ready for use.

This list is <not> intended to replace any of the existing packet-related mailing lists. It <is> intended to provide a place where those who are doing -- or are interested in -- wide area packet networking can share experiences, debate technical/political/regulatory issues, and coordinate with one another as separate networks start to connect with each other.

The list's address is netsig@tapr.org. To subscribe, send a message to listserv@tapr.org with "join netsig" in the text. Traffic hasn't been too heavy yet, but you can help change that...

The Regional Networking SIG will hold a meeting at Dayton on Saturday evening, April 30, at the TAPR suite at the Radisson Inn. The meeting will start at about 8:15, following the annual digital dinner at McNasty's. All are welcome to attend.

You can contact me for further information.

Hi,

I'm a newbie that wants to get into packet modems, primarily to connect
to my Linux server at Tech. I've heard that you get a program called KA9Q
that would enable you to do so. Is there a FAQ available somewhere regarding
this, or better still, a FAQ covering everything discussed in this group?

Thank you in advance,

--Jean (jaggen@pennywise.ee.ctech.ac.za)

I guess this is directed to me again. I never said that CW/VOICE is
more efficient thatn packet. I really don't know. What I am saying is
that there is room for all modes in traffic handling. I don't like the
attitude that ALL traffic should move over packet just because it's newer
and (whizzier?) than the *old* modes. There are problems that need to
be solved on the packet handling of nts traffic, and there are problems
that need to be solved on the other modes of handling nts traffic. Let's
try to solve the problems and quit arguing which is or is not better, as
well as quit attacking the individuals who may happen to like something
other than packet. I use CW, SSB, RTTY, FM and packet for traffic.
(Maybe even some mode that I have forgotten). I'd like to try traffic
over the satellites, but I haven't gotten around to that as yet.
I will use any mode for traffic that gets the job done, but I am not
going to limit myself to any one mode, even if it is the
"newest and greatest and not in the dark ages".

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I didn't mean it to be quite so personal as it turned out.

I too except for the past 3 or 4 years hv handled my share of NTS tfc via
CW and voice, some via RTTY several years ago.
I do retrieve and deliver any NTS tfc for my area if it shows up on a lcl
pkt BBS.

I agree, use the mode tt gets it there the fastest and surest way possible.

It would be good to "publish" the Text of the ARRL numbered radiograms
together with the exp[lanation of its use on the PBBS systems. It shud be
done periodically, say twice a year, or at least annually.

1098. Re: Mocom 35 for 9600

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-15 19:12:00 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <71409@uugate.wa7slg.ampr.org>
Source record: 49493

I modified a Motorol Mocom 35 for 9600 baud. It is presently in use
on the U of U Gateway (UUGATE) and it really works quite well...

But it was a fight to get it that way.

The TX 'mod was really quite simple: The XTAL-varactor 'mod shown in the
9600 Baud Handbook by wd6ehr works well. I biased the varactor at
5 volts and that provided a nice, linear transmit waveform.

Of course, the source of your bias should be well-regulated. I just needed
a little bit of current and used a 7.something volt zener, but a 7808
(if you can find one) would work OK. DO NOT use a 3-terminal regulator of
more than 9 volts or less than 6 volts since too high, and you can begin
to suffer dropout of the regulator, and too low, your biasing runs out of
"room."

The receiver, however, was a different problem. I may have been better off
using something entirely different, but since I already had the crystal, by
damn, I was gonna make it work!

The first (and biggest problem) are the 10.7 MHz xtal filters in the 1st IF.
There were 2 cascaded filters there. In sweeping them, it was readily
obvious that Motorola had not only cut corners, but bulldozed down a wall.
The input matching was nonexistant resulting in a "ripple" of over 8 db in
the passband, and an overall passband of about 13 KHz: That alone was
enough to cause a problem. Moving on the the 2nd IF (455 KHz) things
were not as bad: The filters were flat (if properly tuned) and wider
(about 15 KHz at the -3db points) but were stubbornly refusing to go wider.

It was also noted that the discriminator's "S" curve was not of wide enough
bandwidth to make me happy. At the +-8 KHz points, it was "flattening"
out a bit - Probably enough to work OK, but not a comfortable margin for me.

It was radical surgery time.

Starting with the 2nd IF, I removed the second pair of 455 KHz resonators,
(Y5 and Y6) bridging the position of Y5 *OR* Y6 (ONE only!) with a 0.01uf
capacitor. Noting that each resonator is tuned for a different frequency
(they are marked... sort of...) , parallel them across their like-frequency
counterparts in the first part of the filter. You can then sweep and flatten
the response of this filter stage and the -3db bandwidth should be on the
order of 17-18 KHz.

The discriminator was a bit awkward to modify owing to the parts locations,
but I paralled some 47k chip resistors (available at Radio Shack) across
R35 and R36. This will widen the S-curve a bit, while lowering its output.

For the 1st IF, the most dramatic changes had to be made. Neither crystal filter is "red-hot" as far as usefulness, but in my radio, the second one (Y2) was the wider of the two. I ultimately used an xtal filter like the 2-pole version sold by Digi-Key. I removed Y1, and capacitor C15 (I think... its the one between the two filters).

Now comes the tricky bit. Dig up an old 10.7 MHz IF transformer from an old FM radio. Also, find an MPF-102 FET. Ground the Drain, and connect the gate to the output of T1. Find the high-impedance winding of the 10.7 MHz IF can (make sure you don't have the discriminator can!) and locate the centertap. Connect the source of the MPF-102 to the centertap of that winding through a 330 ohm resistor, connect one end of the winding to the +10volt regulator supply with a bypass cap to ground (0.01 uf or so) and the other end to the input side of Y2. Most of these 10.7 MHz IF cans have built-in capacitors, but you might want to make sure. I soldered this circuit to the side of T1. The 330 ohm resistor is a stability measure. It kills the tendancy of this whole circuit to self-oscillate. In the end, this circuit still has gain.

Now, peak the signal adjusting T1. Sweeping the system and monitoring the passband shape (looking at the emitter voltage of Q4 with a 'scope will give a useable indication of signal input) adjust alternatively the transformer you added, and T2 (touching up T3, too) for a nice, flat passband. You will get a ruler-flat passband through the 1st IF at the filter's "natural" bandwidth, but you can push it 1-2 KHz wider if you don't mind a bit of ripple (1 db is perfectly acceptable, 2db is liveable...) and get the BW wide enough.

When I was doing this, I noted the ability to tune the 1st IF xtal filter to a few KHz either side of some point and form a passband. You will want to make sure you pick the "correct" one (the upper one, I think) so that the passband of the 1st IF and the 2nd IF occur in the same frequency range after the 2nd mixer. Also you might want to check the 2nd LO and see that it is on-frequency.

When I was done, the receiver had a sensitivity of 0.5uv w/20db quieting. Its bandwidth was wider than before (obviously) and if you have adjacent channels, you probably won't get away with doing this modification. We don't, so its OK.

Keep in mind that you'd want to take the RX from the junction of R37 and R38 and run it through a unity-gain OP-AMP stage (i.e. "-" input tied to output, input on the "+" side through a 1uf cap, input biased at mid-supply through a 1 meg resistor) since the output impedance of the discriminator is very high.

Also, the PTT circuit is not properly driven by the TAPR modem: You will either have to reduce that 100 ohm resistor in series with the MOSFET on the TAPR board, or build an outboard PTT that has more gusto.

It was a pain to get this radio to go at 9600 baud but now that I've done it... It works quite well and is pretty fast in its turnaround. Note that on the TX, you lose most of your temperature compensation with the

modification and I made no attempt to restore it (a well-placed thermistor would go a long way...) since it is sitting in a temperature-controlled shack that is always between 60 and 80 degrees F...

I put the radio on our local frequency of 431.75. I had to add 1/3 turn to 2 of the helicals in the post-preamp filter, and I used high-side injection for the LO. I also had to re-tune Z105, the "Harmonic Filter". In the end, it gave me over 15 watts when cranked up, but I set it for 10...

Again, this 'mod is a pain, but it *is* possible... Anyway, if you have some Mocom 35's for sale, cheap, let me know:-)

What might even be nicer, and maybe some boards do have it, would be a
'lookup' feature, where you could sent 'ARL FIFTY' (for example) to
the board, and it would return the text.

Hi ....
Neither my two KAMs nor a number of friend's KAMs were provided with
Hostmaster programming character information. When an inquiry was made
at Dayton one year, they stated that the programming information was
proprietary and would not be released.
Perhaps it is due to having the older KAMs.
Can anyone with this Host mode programming information provide a
copy?

1102. PoorMan's Packet- Serial Interface?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-15 22:35:06 UTC
From: conklic9391@cobra.uni.edu
Message-ID: <1994Apr15.163506.26103@cobra.uni.edu>
Source record: 49497

After runing the Poor-Man's Packet for several months, several others have shown interest (locally) in doing likewise. At the same time, we are setting up a packet station in our local Civil Defense office. Seeing no donations of a TNC in our future, we turn towards the PMP.
The problem: the 73 article interfaces via LPT, which is fine for 20+/- feet, but the CD office is configured so that our radio cubbie hole (and the coax lines to the roof) is 50+ feet from where we can put the computer. (our cubbie hole is filled with HF and VHF voice already). This seems TOO long for reliable parallel communications. Also people would like to dedicate a printer to LPT1 (there are no expansion slots in our donated computer).
The solution:(?) I heard/seen(?) discussion on interfacing the PMP to a RS232 standard port, and then reconfiguring the PMP software or using Baycomm or the alike. Does anyone have a documented mod available for FTP, or has anyone else traveled down this road before who is willing to save me some grief ;-).
Any responses to the group or by email, on the hardware or software are greatly appreciated.

Tnx, 73 de N0PAV

You probably need the TNC to keep up the DSR signal... Most things don't care, but a lot of terminals actually follow some of those data signals that are often ignored on PCs, etc... you'll prolly need to change DSR, maybe DTR, CTS and RTS, and if your TNC is capable maybe turn on XON/XOFF. I don't know how... I'd love to get into packet but haven't found a TNC, this advice is all from using modems and getting them to work, so don't ask for specific commands or anything... 8-)
Good luck.

Source record: 49504

Hi! :)

I don't currently have a license, but i plan to get one soon, and
had some questions about packet. I think I understand te basics, but the
specific usages of it are an unknown to me. I've heard there are packet BBS's,
but can you access the Internet through packet? What do you need to do it?
Also, I know I need a packet modem, so I was wondering if anyone can
recommend any? Are there different types of packet modems?

Thanks,

Laurent -(*)-

Please post on the newsgroup, since I think others might be interested

>Now, to the code writing.

Hi Steve,

Glad to here that you found the information on the KAM. Sorry
I did not get back to the net earlier, I would have gladly copied
the four or five pages on the Host Mode for you.

Drop me a note if I can be of assistance. And when I bought my KAM
it came with the version 5 manuals, that explains why I had the
information here.

We are pulling up ancient history here, so don't expect me to remember the exact command...however, DED does have kiss mode in it. I too was surprised to find this out several years ago from a third party. I used it in kiss mode for some project for a short time.

|> and it works just fine. Of course the interface is designed to be
|> computer rather than human friendly, and I have always been strange.:)

I think, you think of the wrong eprom. There are following TNC2 'operating' systems around:
- TAPR A commandline driven firmware controlled by several Controlcodes. The only computer controlled mode is KISS.
- TheFirmware Based on WA8DED. I think it is more user friendly than TAPR, because you need not remember so many command words. Usually this software has one mode in it which is called Hostmode (entered with ESC JHOST) which many packet programs use. The lack of this mode is, that only level 2 links are possible, so you cannot cross-digipeat or run TCP/IP on it. In Germany usually KISS mode is available under TheFirmware, too, and it is entered with something like ESC @K (but I'm not sure about this). I cannot speak for other countries, but I think it is true for whole Europe.
- TheNet A complete NetRom compatible Digipeater which is based - no wonder - on the same basic code like TheFirmware (but extended by NetRom Level 3 and 4). This Digipeater only supports HDLC mode on the serial port, so it can only be linked with other TNCs.
- KISS-ROM There is a 2K KISS Eprom around, mainly in use with WAMPES (Unix on Amateur Radio), and which can only be driven by computers.

|> My only complaint is that there is/was no version with KISS in it.

So you are both, right and wrong. There is no KISS in original WA8DED, but there is KISS in the more modern TheFirmware which is based on WA8DED.

PS: I looked at the sourcecode of the last 3 'operating' Systems, and they share common parts. But I never heared about the sourcecode of TAPR Firmware ...

1116. On-Air Encryption?..

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-16 17:39:58 UTC
From: rwhittak@docwhitehoorse.doc.ca
Message-ID: <1994Apr16.173958.2447@clark.dgim.doc.ca>
Source record: 49511

Greetings from Whitehorse!..

I've been working with the DOC on a project to use digital radio in disaster situations to connect with the Internet via RF links to router stations with satellite dishes scattered around the territory. We've demonstrated the effectiveness of this system to "the powers that be", although they raised the question of security of the data stream between the remote site (the on-scene packet station), and the dish. This link would be made on pre-determined "commercial" frequencies, so the question arose as to what encryption schemes there were to bolster security of information passing over the air... Does any such scheme currently exist, and if so, where would one find it and how good is it?.. Any information would be of great assistance...

Thanks in advance..

Cheers,
Rich W.

Hi everyone:

I bought KPC-3 TNC and tried to install set it up. I could get TNC to talk to PC and vice versa and it keys transmitter. But the problem I am having is monitoring the calls. The LED light of receive lights up but I dont see anything on monitor. I tried all possible setting given in manual but I could not get to work.

If anyone is using KPC-3 TNC, will you please help me with this problem.UD*,j

This is exactly how PGP signatures work (I think they also include an
identifier for the key used). They use MD5 and RSA. (Note that RSA
is subject to software patents in the USA and is not exportable.)

(Actually DES is allowed to be exported in its use in authenticating Unix
passwords, although the encryption and decryption functions are disabled
in export versions. A PGP which only supported signatures, would probably
be exportable from the US.)

Looking for your thoughts on which is the best HF TNC
I'm not talking about features.... I mean raw quality
of the FSK Modem performance type issues....

My own experience is that the PK232's fixed freq filters
tie your hands a bit but seem to pretty good. I heard
a rumor that AEA said at one point that the 232 was better
for HF than the their DSP stuff... but that was the first
DSP units.

This will undoubtedly stir things up but let's see what
you guys think!

Kantronics has excellent packet software for the Macintosh (I wrote it). It's called HostMaster for the Macintosh and should be available from most ham radio outlets or directly from Kantronics. You may also order it directly from me for $69.95, including shipping. Feel free to contact me for further info.

Please note: HostMaster for the Macintosh is for Kantronics tncs only (KAM, KPC-3, DE, etc). It does not work with AEA, MFJ, or other tncs (sorry).

From the abv it appears you hv sufficient funds available ort are now bankrupt almost. Hi Hi
So, U might start with the PK-96. I know it'll do 9600 out of the box and I believe also 1200 baud. Then you need a radio to handle the 9600. I bought a TEKK 70 cm unit, they wrk FB. I use an Alinco DR-1200 for 1200 baud. I hv not tried to modify the Alinco for xmit (my eyesight and lack of guts hinder it after I opened the box and modified the rcv input for 9600) However, the rcv wrks FB! at 9600 baud.
I use NETNac tcpip software almost exclusively (FREEWARE-courtesy of PA2AGA et al) a Macintosh adaptation of Phil Karn's earlier code. I like it vy much!
I use a PK-232MBX but am looking for a discrete 1200/9600 unit.
I'm using a Mac IIvx.

A FCC type approval sticker is meaningless. I purchased a mailorder 486 DX2/66 PC, which emitted gobs of RFI from its unshielded plastic case, keyboard and monitor. I complained to the local FCC field office, who directed me to the FCC BBS. (Don't have the number handy, call your local field office.)

The registration number was 2 or 3 years old, for a 25 mhz 386 machine. It didn't specify the type of cabinet, keyboard or monitor.

Your options are:
- Purchase reputable brand names. Look for a decent quality cabinet. The plastic front piece should have a metal coating on the inside. Also look for spring contacts to ground that metal coating to the rest of the case.

- Complain to the FCC. They probably can't help, but remaining silent means you accept the situation as it is.

- Fix the PC yourself. You have to do this anyway if you're into digital modes that require the PC and radio to be in close proximity.

>but can you access the Internet through packet? What do you need to do it?

There are gateways, and all you need is ordinary packet equipment to access them, but the catch is that there has to be a gateway near enough to you so that you can access it. That's a local question you'll have to ask. There's almost certain to be a BBS within reach, and Email can be forwarded to a gateway station via the BBS network. The whole internet-packet arena is strewn with minefields, however, because of content concerns and third party traffic concerns.

> Also, I know I need a packet modem, so I was wondering if anyone can
>recommend any? Are there different types of packet modems?

There are three basic ways to go. The most common method is called a TNC or Terminal Node Controller. This is a box with a modem, a PAD, or Packet Assembler Disassembler, and channel access control firmware. The latter two functions implement the AX25 level 2 protocol. You have a RS232 port on the TNC that you connect to a computer or terminal, and audio in/out and PTT that connect to the radio. No special software beyond a simple communications program is needed on the computer, though there are packet specific programs available with nice features tailored to packet operation. There are many different TNCs on the market, varying mainly in the degree of sophistication of their internal modems (DSP, filter, or PLL), or in being able to do different protocols, such as RTTY and AMTOR, as well as AX25 packet.

The second method is to use a simple audio decoder board, like the Baycom unit, attached to a parallel or serial port status bit. The computer then runs "bit-bang" software to encode/decode the data stream. The program also functions as PAD and channel access control. This is a cheap, if you have a spare computer to dedicate to packet, but fairly low performance way to get into packet. The "modem" board is very rudimentary and won't perform very well in the presence of noise. And speed is generally limited to 1200 baud or less. It's generally "good enough" for the typical 2 meter FM 1200 baud activity.

The third method uses a plugin card for your computer that acts as a high speed HDLC channel, often with full two way DMA capability. Like the Baycom method, special software is required in the computer, but unlike Baycom, no bit-banging is required since the HDLC is done

in hardware. Typically a high performance external modem, either high speed, 9600, 19.2kb, or 56kb, or a sophisticated modem for HF at up to 300 baud will be attached. Typical cards are the Ottawa PI card, or the Gracillis card. This sort of setup is the most flexible and powerful, often used at high speed switch sites.

Sure, the TNC-2 will work with a dumb terminal, so any simple communications
software you have for the Atari, or any other RS232 port equipped computer,
will work.

>a rumor that AEA said at one point that the 232 was better
>for HF than the their DSP stuff... but that was the first
>DSP units.

Filter demodulators generally work better at HF than PLL types,
though that's implementation dependent. They handle the selective
fading and adjacent channel interference issues better than PLLs,
especially if the firmware will allow copy using mark only or space
only in case the other channel is clobbered. DSP filter demodulators
should be better than typical hardware filters, but that hasn't been
the case in early implementations. Dynamic range limits, and simple
coding models have restricted the potential of DSP.

The filters in the PK232 aren't great. Their noise floor is high and
shape isn't optimum. An external demodulator, which the PK232 design
allows, can work better. Something like a ST-6 or one of the newer HAL
products works well as a external demodulator.

>Mike, K0TER

ick. maybe it's time to consider doing away with numbered radiograms. just type in the darn message and number it (something the system could do) and away we go.

even better...someone could write an NTS composer program that would allow the not well versed traffic generator set everything up at home w/o even getting on the air and then his messages would get sent in batch form to the BBS system - maybe even using some compression to keep the transmit time short.

the nts composer program would ask for all those things people leave out today. could have a mailing list in it (yeah, i can see another onslaught of those messages sent to everyone in the QCWA directory (or whatever it was) by a W1 that didn't have anything else to do...). overriding something would be doable, but not until the program protested about leaving out the phone number and state might result in an undeliverable message...

heck, it could even send the stuff out as CW if you must. (special option lets you pick from ARL lists and correctly generates a check number and gets a message number from the originator.)

the trick is to not spend time cluttering up the air with repeated requests for information (you could get that ARL list once and keep it so you don't have to look everything up on line EVERY time...) or with a BBS ports connected to someone doing manual typing of commands.

something that might look like Aladdin or TapCIS might be the ticket.

>getting setup so I can monitor while I wait for the FCC. Any and all help
>would be greatly appreciated.
>Thanks and 73,
>Richard Harris

when i last looked, Macs come with serial ports. you need a cable to get from the computer to a standard modem (that's what the TNC will look like to the mac) and a dumb terminal program (bet you have one of those for free in the box-o-software that comes with the average computer these days).

there are fancy "packet programs" but if you have a looks-like-a-modem TNC and a terminal program, you can make do just fine. you'll have to set the terminal program to think it's hardwired to a port and not a "Hayes compatible" or whatever so you don't send stuff to the TNC that it can't understand.

usually the "packet programs" seems to be an exercise in clashing colors and noise making with keystrokes that make DOS WordPerfect a model of standardization. they aren't without their benefits, but they suffer from not being organized very well and can be insurmountable if you aren't technically up to speed on the computer side and are doggedly persistant.

i suspect that's changing, but i get along with the dumb terminal type stuff just ever so fine that i don't see a need to pay for frustration.

From: dfajardo@netcom.com
Message-ID: <dfajardoCoFC4w.HF9@netcom.com>
Source record: 49528

I am looking for either (1) A utility to convert from a 'binary' format (ie: no formating) to the 'intel hex' format for feeding to my EPROM burning program or (2) A discription of the aformentioned 'intel hex' format which would allow me to write such a utility myself.

I have partially deduced the 'intel hex' format, but if I could find a complete description somewhere...

Thanks In Advance.

should work if the atari has an RS-232 serial port on it. the TNC looks like
a modem to the computer (you have to set up the comm software to not treat it
as a smart modem but as a hard wire connection or other to prevent sending
smartmodem setup strings out on the air...8)...)

Source record: 49530

<...is it possible to run Jnos from a 720 k floppy...?

I tried to get a minimal functioning version of Jnos for a old 386 w/ no hard drive that I use for my NOS box. Jnos was just over 700k, but pa0gri fit in 430. Dont forget you need to have your FTPUSERS file, a resionable autoexec.nos, the program executables, and a directory structure set up for /spool/mail /spool/mqueue, etc. And you want to have some room for received mail. I decided on PA0GRI because I wanted to have some reasonable mail-handeling capability.

Good luck and 73 de n9pli, Tom Eckels

Just my usual reminder that NET/Mac permits AX.25 and NETROM connections
in addition to TCP/IP sessions. (All simultaneously, if different
protocols are allowed on the channel you're using.) This is true of
the versions of KA9Q's software for other computers, too.

I keep running into people who think that NET and NOS only do TCP/IP,
so I like to make it clear that they're all-in-one programs.

Appreciate all the help and suggestions. The final solution turned
out to be just a matter of using a breakout box to block all of the cable
conductors except 2, 3 and 7. Then turned echo on and activated XON/XOFF
handshaking. Works great now. Should be fun trying it out on field day.
Now I just have to make up a new cable and return the breakout box.
73 to all and thanks again for the help.

|> keeping track of the header information on the messages I deliver
|> that travelled by packet and the 5 to 10 days is the norm/.

Ok, I'll tell you what to do to solve these problems.

This is what we do in our part of the network whenever problems such
as you describe occur. Once located, the problem is usually quickly fixed.

With respect to these 5-10 day delays you claim to see:

1. Track the messages to find out where the delays occur.
2. Send this information to SYSOP@USA (or to the appropriate sysops
directly) so everyone involved knows where the problems occur,
and can work to fix them.
3. Create better routings so the delays do not occur.

If the above is not clear, then simply post a few messages to SYSOP @ USA
including the headers from these delayed messages. We can't fix anything
until we know where the problem occurs. You have not given us that
information yet.

With respect to the duplicates you claim to see:

1. Track the messages to find out where the duplicates occur.
2. Send this information to SYSOP@USA (or to the appropriate sysops
directly) so everyone involved knows where the problems occur,
and can work to fix them.
3. Adjust your forwarding or connect parameters so the duplicates
no longer occur.

If the above is not clear, then simply post a few messages to SYSOP @ USA
including the headers from these duplicated messages. We can't fix anything
until we know where the problem occurs. You have not given us that
information.

The above is simply common sense: it is how we manage the network so it
will meet reasonable requirements on delay times, etc.

Do we see delays and duplicates like this in the Pacific NW?
Yes, of course we do.
Do we allow them to continue?
No, we do not.

We manage the network to locate and repair problems like this.
They are usually simple problems that yield to simple solutions.

Hi Gary,
This is precisely the type of description of what you need for packet that
I have been looking for for quite some time.. thank you. :)

Now, my question is, can I run audio line out from my scanner to a TNC and
just reconstruct packets from nearby machines? I know that the TNC won't
be able to request retransmission of bad packets so there will be an error
rate, but what kind of results can I expect from that setup? I'm interested
in packet, but the license is down the road and I'd really like to get a peek
at it before I dive in.

I have a PRO-2006 with an extended duck.. discone probably soon.

>
>73...Jim
>N2VNO

I bought a mail-order 486DX2/50, but I checked first when I ordered it about not only the Type-B rating, but the metal case. From what I could determine over the phone, it sounded good. It was good. I have the PC literally right next to the radios (HF and VHF) and have no problems, even on the digital modes. I did not have to do anything to chase RFI. I do have things grounded.

I don't know why anyone would keep a machine that is such a problem, unless you have the time and inclination to go through all that... If it's too noisy, send it back. After all, it's a big investment and

you're gonna have to live with it.

-Seth

Hello,

I'm trying to locate the person coordinating ip address assignments
in Northern California. I have a very old list, which I don't have
much faith in.

Thanks,

Robert

mail bounced, so here you go:
you can get the ax25 specs by mail from arrl or tapr.
send a msg with no subject and lines
HELP
INDEX
to info@arrl.org
or to file-request@tapr.org
a msg with no subject and the following lines:
HELP
that should you get some infos on how to use the mail-servers
and an index of files for the arrl. they both have the ax25
specs somewhere

?
NO, actually it should read 14.081.1 (minor typing error), and if you are
running a Kenwood you will want to center-tune at 14.081.2 instead. This
will put mark at the requested frequency with space 200 hz down from there.

If you have trouble copying, remember to also check your TNC's TxRev and
RxRev settings when running inverted like this.

Once we get beyond the old adage "Never answer a question with another
question," the first question I ask is the working definition of "security"

in line 5 of your query. Are you/they trying only to guarantee message
integrity (that what is received is what was sent), are they concerned with
authentication (that the entire message was not sent by or received by
other than the named parties), are they worried about some casual listener
eavesdropping and disclosure to the public, or are they planning to occupy
Internet/UseNet with militarily classified or secret messaging? The answer
to this question will at least define the starting point and weed out
methods
which may be inadequate for the task at hand.

The integrity issue is easily handled by using robust error-checking data
protocols over the RF channels. This is quite common over commercial HF,
but don't expect any great throughput on HF, especially with band
conditions
like they were for the last week! The authentication issue probably should

involve a PGP system. Casual eavesdropping is as much a problem on Internet

as it is on HF radio, since anyone can watch all the packets go by if they choose. The military security issue and serious encryption of the message contents can easily be handled using products and techniques currently available to those agencies through their normal procurement channels, albeit at rather high price tags for the mission you have described.

FLAME ON! - The public and private sources who fund the various national relief organizations and their regular operations charter them to deliver assistance to affected areas in times of need. Relief agencies who are more

worried about the encryption of their operational data than getting emergency
relief into the field during natural disasters are not providing the services
to those who need them, but to themselves instead by diverting funds from the intended use.

Source record: 49453
Cross-posted to: comp.dsp,rec.radio.amateur.digital.misc

F.Y.I.

There are two excellent articles about DSP in the new May 1994 issue of BYTE Magazine.

The first on pp22,23 carries the title "The Engines to Make Multimedia Mainstream". This two pager covers the Microsoft DSP API and a nice half-page on the TI TMS 32OC80. The article has a pie chart that indicates a trememdous growth (728$mill to 2,493$Mil) in DSP sales from 1993 to 1997.

The second article is on pp 81-86 and has the title "Desktop Data Conferencing". There is an excellent chart showing various picture formats and the corresponding required bandwidth for uncompressed and compressed transmission. DSP is highlighted as the solution to bringing Teleconferencing to our bandwidith limited telecommunication channels. Page 84 has a 2/3 page special inset on "DSP's and the PC Mainstream" that clarifies the DSP API and the AT&T VCOS, IBM MWAVE, and SPOX. The various "DSP Operating Systems" are displayed in a brief figure on the same page. Page 86 has a table depicting 15 different alforithms (CLEP...G.711...V.32...) and their bit stream speeds and DSP requirements.

Good articles with more than introductory information.

N6QMY/BBS Internet Gateway Operating Instructions
April 11, 1993

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem
port (510-795-xxxx) or via one of the 4 tnc ports (145.09, 145.79, 223.62,
or 441.50). Each local user has a bbs account that is used to customize
how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed
to their call will be forwarded via a gateway to internet and on to
other networks (mcimail, compuserve, etc). All the user needs to do is
enter his email address and turn the feature on.

EMAIL bob@hal.com
EMAIL ON

When the EMAIL feature is turned on the packet message will be deleted
at the time of forwarding through the gateway. So care should be taken
that the paths are correct prior to turning the feature on, for instance
enable it, send a test message, and disable it. After a successful
transfer re-enable the feature. To disable the auto forwarding feature
simply type:

EMAIL OFF

Messages can be sent by packet users to the internet users via the gateway.
This applies to users at N6QMY as well as users at other bbs's. Begin by
sending a message to IPGATE@N6QMY with the first line of the message being
the letters "To:" followed by the internet address of the recipient.

KB6UCZ de N6QMY >
sp ipgate@n6qmy
Enter your subject:
Meeting?
Enter your message body:
To: bob@hal.com
Are you planning to attend the club meeting on Thursday? Give me
a call. 73, Theresa
^Z

NOTE: That the recipient cannot respond to the message unless they
are a ham and registered with the gateway. He/she becomes registered by
sending a message from his internet host to gateway-request@lbc.com.

REMOTE USERS:

Remote users are those that do not log into N6QMY directly but merely
appear from the packet world to use it as home. If a packet user checks
the "White Pages" for a remote user the entry comes back as @N6QMY.
The packet user then address his message to YOURCALL@N6QMY and the
bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address
nor use the SP IPGATE method described above. From the packet network
it appears that you are just another user at N6QMY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most
bbs users in the US are represented in the database as well as many from
other countries. When a user chooses a home bbs, that bbs generates
an update that is sent to the regional servers and then distributed to
all the other bbs's. An entry consists of; call, home bbs, first name,
zip, city and state. When a user wishes to send another packet user
a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet
into the bbs system he/she must register with the gateway. This is done
by sending a message from the host that he/she intends to use to
gateway-request@lbc.com with the following information:

CALL:
FIRST NAME:
CITY & ST:
ZIP:

HOME BBS:

When a request is received the "From" field is copied directly into
a file with the requesters call. Whenever the gateway receives a message
bound for packet it scans this file comparing on the "From" field. When a
match is found the gateway uses the associated call from then on. If
there is no match the mailer bounces the message with a one-liner
indicating the the user must register.

If you currently use another bbs as home this needs to be stated
in the request. Otherwise you will be assigned N6QMY as your home.
If you choose not to use N6QMY as your home you must make sure
people know to send your message to YOURCALL@N6QMY to pass through
the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to remote users by sending a message to the bbs. Here is a subset of the commands currently available.

LIST listing messages
LOOKUP look up calls in the on-line callbook
WHO call dump a users account information
READ read messages and files
USERS n display the last n users to connect to the bbs
INFO display manual pages of various topics
CD change directories in the file system
LS/DIR display the contents of a directory
WP call look a user up in the "White Pages"
HELP get help on how to use a command

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

LIST LAST 20 BULLETINS FROM N6QMY
LIST ALL BULLETINS ABOUT KENWOOD

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.

This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

L< N6ZFJ
LIST FROM N6ZFJ
LIS < N6ZFJ
L FR N6ZFJ

In most cases a minimum number of unique characters is needed to distinguish a command.

You can get a list of commands and a translation chart from the W0RLI BBS command set to the N0ARY BBS command set by typing the following commands:

INFO COMMANDS
INFO W0RLI

Other commands that you may wish to execute are:

INFO MANUAL
HELP HELP

HELP LIST

Now that you know what some of the commands are this is how you go
about executing them. You send a message to cmd@bbs.lbc.com
with your commands entered one per line or separated by semicolons.
For example if you want to know if three of your buddies are in
the white pages and if the bbs has any messages about the ICOM W2A.

Send to:
cmd@bbs.lbc.com

Subject: you can put anything here
wp n0ary n6zfj n6une
list all about w2a
.

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send
messages from his host through the gateway into the packet world.
How much you have to specify of a users address depends on how much
the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to
the N6QMY bbs, which many of them are, you simply need to supply
the call of the user.

n6oim@bbs.lbc.com

If the N6QMY bbs doesn't know of the user but does know where his
home bbs is, then you need to supply just the home bbs call in
addition to the users.

n6oim%n6iiu@bbs.lbc.com

Notice that the call and home bbs are separated by a percent sign '%'
rather then the '@' which is used in the packet domain. This is because
the '@' has a meaning in the internet address.

If the N6QMY bbs has no knowledge of either the user or his home bbs,
then you probably have the wrong home bbs or it is a new bbs. In which
case you will have to supply the full address so the bbs will know
how to route the message.

n6oim%n6iiu.#nocal.ca.usa.na@bbs.lbc.com

This level of addressing is hardly ever needed and normally means that
the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up
of a keyword, which can be any six character word and a distribution.
Distributions are local to an area. For instance SBAY is valid in
northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:
ALLUS please avoid this one
ALLUSW all western US
ALLCA all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

Send to:
want%allca@bbs.lbc.com

Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please
give me a call or leave message, thanks.
73, KB6UCZ@N6QMY.#NOCAL.CA.USA.NA
.

Be descriptive, brief, and always include your full return address in
the message. Also please try to limit your distributions to small
regions. Using the ALLUS distribution really slows down the flow of
messages.

INFO ON THE N6QMY BBS:

The bbs came into being in April of 1993 and was the second one anywhere
to run the N0ARY BBS code (the first being N0ARY himself). The bbs has
4 rf ports, 1 phone port, the internet port, and is working on a voice synthesizer port.
The latter would allow users to check for messages
via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was
written by Bob Arasmith (N0ARY) to focus on the user. Great care was
taken to make the bbs very forgiving to the novice user but very flexible
and powerful for the old-timer. The bbs can be configured to interact
with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed
when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying
before scrolling, the bbs will feed info this many lines and pause
allowing the user to catch up and continue or abort the operation.
Similar to more.

* Users can put commonly executed commands in keystroke macros that
are accessible via a single keystroke.

A manual is currently available describing the commands and their
permutations. This manual will be available later this year as a
postscript file. Run the command INFO MANUAL to learn how to get
one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs
in general please drop me a message.

I guess you don't deliver much traffic. Some of us who do, prefer not to
spend our whole lives at it. Remeber that there IS a human doing the delivery
at the other end, and that NTS traffic is often send by and received by
NON-hams.

These are all excellent suggestions. The problem is, the folks who handle
NTS traffic are not necessarily interested in the WAY that the tool (packet)
works, just that it does work. I don't see anything wrong with that approach
to packet at all. I, for one, do network stuff for a living, and like to do
something OTHER than debugging networks when I get home.

Perhaps the packet network systems should have some sort of routine test
messages that get spread over the various paths and analyzed? There is no
real reason to rely on end users to report problems of this sort.

>They are usually simple problems that yield to simple solutions.

Now if the network were as well managed everywhere, we'd be all set. It
takes people who WANT to spend their ham radio time doing this. I'm sure there
are such people all over, but they are not necessarily the ones handling NTS
traffic.

Here is the short list of I have. It's probably not complete and some of
the older ones may no longer be operating. I haven't verified any of these
except N0ARY which the one I use.

Does anyone know of any we can add to the list? Especially any in
Southern California?

You can try telnetting into 44.16.0.61. That's the JPL Internet link in Pasadena. They might still have the direct conference link which is a 3600 port number, so just add 3600 at the end of the telnet address. As far as I know, there is no password required. Good luck.

Hello All:

I am looking for a ftp mail server which might have the ax.25 source code and/or executables for the Linux clone for unix. I am working on getting a public access linux station available for the chicagoland area, and the ax.25 protocol for linux would be very handy. I know it exists, but my only internet access is through a service which does not yet provide ftp. If any of you reading this happends to have the code, but not know of such a ftp mail site, I would appreciate Email, so we can work out how I re-imberse you for a copy!!!

Thanks, and best 73

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Editor, HICNet Medical Newsletter
Internet: david@stat.com FAX: +1 (602) 451-1165
Bitnet : ATW1H@ASUACAD

Packet Activities at Dayton

Tucson Amateur Packet Radio April 15th, 1994

PACKET ACTIVITIES AT DAYTON '94

There is a lot going on at Dayton again this year, but here
is information on the packet forum and TAPR activities during
Dayton '94. If you are attending Dayton, we hope you can take
sometime to attend some or all of the activites. If you are a TAPR
member we look forward to you coming by the booth and saying hello.

====== Schedule ======

Friday, April 29th, 1994

12noon - 6:00pm Visit the TAPR Booth and enjoy the show!

1:00pm - 4:45pm Packet Forum, Room 4
Bob Neben, K9BL, Moderator
Speakers:
Packet Radio for the Beginner, Greg Jones, WD5IVD
Packet Parallel Connection, Paul Newland, AD7I
TAPR/AMSAT DSP-93 Project, Bob Stricklin, N5BRG
TAPR BBS SIG Update, Dave Wolf, WO5H
Interfacing WX Data to Packet, Mel Whitten, K0PFX
WX Station Interface, John Bennett, N4XI
TAPR Regional Network SIG, John Ackerman, AG9V
FCC Regulatory Issues, Dewayne Hendricks, WA8DZP
Other speakers as assigned.

7:00pm - 11:00pm TAPR Hospitality Suite
Premier Room, SE Corner of Radisson Inn,
2401 Needmore & I-75
Food, Packet, DSP-93, and More

7:30pm TAPR National BBS SIG Meeting
Premier Room, Radisson Inn

Saturday, April 30th, 1994

8:00am - 5:00pm Visit the TAPR Booth and enjoy the show!

6:15pm (about) Packet Dinner at McNasty's
Maps available at the TAPR Booth
Come have BBQ with the digital crowd

8:00pm - 11:00pm TAPR Hospitality Suite
Premier Room, Radisson Inn

8:15pm (about) TAPR Regional Networking SIG
Premier Room, Radisson Inn

Sunday, May 1st, 1994

8:00am - 12noon Last chance to visit the TAPR Booth
and enjoy the show!
Why 12noon ? We typically finish up early.

TAPR Special Interest Groups
==========
At its March board meeting, TAPR created three Special Interest Groups (SIG) to help exchange information among packet radio users. These are devoted to BBS issues (BBS SIG), to information about building, maintaining, and extending packet radio networks (NET SIG), and to FCC Regulatory Issues (FCC SIG). All amateurs, TAPR members or not, are welcome to all SIG meetings. The SIG meetings will occur at the Radisson Inn, in the Premier Room Saturday and Sunday evenings.

TAPR National BBS SIG Meeting

The BBS SIG held its first meeting on Saturday evening, March 5, 1994, in conjunction with the TAPR annual meeting. This meeting will be the second of three scheduled this year.

The BBS SIG is currently considering these issues:
o hierarchical addressing
o education of users to get the most from the local bulletin boards
o education of sysops to get the most from their software
o establishing a library of case studies so we're all not constantly 'reinventing the wheel' when we set up or upgrade a BBS
o establishing a list of standard 'TO' and '@' fields

The Friday evening session will discuss these and look at what other issues the BBS SIG should begin to exam. Please come join this meeting of the minds.

Dave Wolf, WO5H, BBS SIG chairperson

TAPR Regional Networking SIG

The NET SIG held its first meeting on Friday evening, March 4, 1994, in conjunction with the TAPR annual meeting. Below is the

list of current issues.

1. Establish a collection of networking case studies for the
benefit of those implementing networks.

2. Establish a database of people interested in networking.

3. Get discussion going on how we're going to interconnect
regional networks.

4. Discuss the role of packet <--> internet gateways in
the network scheme.

The NET SIG will meet at the Radisson Inn in Dayton on Saturday
evening, April 30, after the McNasty's packet dinner. Come to the
Saturday evening session and LET'S HEAR WHAT YOU THINK ABOUT THESE ISSUES!!

John Ackermann, AG9V, NETSIG chairperson

1174. ka9q nos help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-20 13:35:24 UTC
From: flynn@nadc.navy.mil
Message-ID: <9404201335.AA05080@NADC.NADC.NAVY.MIL>
Source record: 49469

Hello,
I am looking for an ibm xt version of ka9q nos. I have ftped
the ucsd.edu directory /hamradio/packet/tcpip and downloaded the file
FAQ-1292 and it has alot of good info but not alot on the NOS files in
that directory. Does anyone have a discription of the files in
/hamradio/packet/tcpip?
In addition, there is a nos.exe file in that directory. Is that
compiled for an xt?

Finally, can anyone point me to systems other than ucsd.edu
that contain tcpip code and info.

Thanks in advance!

Dan Flynn WW3N

1177. Packet radio info?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-20 15:55:34 UTC
From: ron@argus.lpl.Arizona.EDU
Message-ID: <2p3j9m$764@auggie.CCIT.Arizona.EDU>
Source record: 49471

I would like to get some basic information about packet radio. I was told
that packet radio would allow one to make a connection between a unix based
host and a internet network. That's about all I know.

I would like to find out what kind of hardware is required, what software?
How fast is the connection? Right now I use a modem, is the speed of packet
radio listed in baud similar to modems? What would be the cost of a system
to connect me from my unix box at home to the internet at work? Is packet
radio similar to slip in that you establish a duplex connection and transmit
ethernet packets? Is a IP address required? How much power is required for the
transmitter and how much range can be expected. Is lline of sight required?
Is the radio connection stable or subject to noise and re-transmission of
packets?

Please respond to watkins@ssvs.gsfc.nasa.gov
Thanks,
Ron Watkins

> Gary

I'm no Motorola expert, but i thought all the syntors where synthesized. (otherwise, wouldn't they have called them Crytors?:) The plain vanilla Syntor, is available in several different models for high band, low band, UHF, and 800. There are probably more. I've used both VHF and UHF models successfully on the ham bands, with no conversion other than reprogramming and retuning. (be a little careful, for each band, there are several different ranges of synthesizers, not all the ranges will work in the ham bands)

As for setting up the prom information on the radio, it's pretty simple, once you figure out all the pin-shift stuff, and frequency data for the synthesizer dividers. I'll bet the info is motorola proprietary, so there is no way I can give you any of the data or prom information, but any dealer should be able to get 90% of the data correct from the factory programer. The pin-shifts on the factory programer will probably be incorrect for amateur use, but you can fix those manually. (providing you have a way to edit the prom data)

I recently picked up a low band syntor X. Reverse engineering the programming codes on that radio is a tad more tricky. It has MANY more features than the plain syntor. All the PL and DPL codes are programmable, as are a timeout timer, pin-shifts, priority and non-priority scan lists, noise blanker, and squelch modes. It's a nice radio and covers 10 meters thru 6 meters! I'm using mine for 29.6Mhz, state police and fire scanning, and 6 meters, all without doing any hardware conversion! About all i have to do is change the antenna on the car when i switch from 6 to 10.

Sorry i can't supply you with detailed data for setting up the radio, but if you just need some info on the pin shifts or synthesizer ranges, i may be able to help you out. FYI the pin shift info and SOME of the programing information is available in

the Motorola service manual. Again, the internal specifics of the prom data is probably owned by Motorola, so check with a dealer if you don't have a GOOD logic analyzer and a lot of patience ! Maybe in another 10 years or so, the prom information will be public domain! (or at least Motorola won't care if it is handed around)

: assistance...
There is a serious question of what is being protected, and what level
of protection is desired. If you simply dont want the media or the casual
public listening in on city operations, you could use something like
PGP to encrypt each message (I don't know where it is currently archived,
but you could find it easily with GOPHER). A LOT of people on the internet
use it. This would require the originator of the mesage encoding the
message before sending it.

If your reasons for needing security go beyond this level, then I suspect
the answer is no, and it probably can't be done in a secure fashion
without getting some kind of crypto gear. (Beware of the DES trap; DES
can't be implemented in software and still be in compliance with the
spec - software implementationsof DES are dis-allowed!).

Because Amateur radio is not allowed to use encryption, no development
of hardware for this purpose has been done to the best of my knowledge.

Good Luck!

Announcing the Ottawa PI and PI2 card driver for Linux

This driver was designed for use with the AX.25 kernel support from
Alan Cox (version ALPHA 017). It works with kernels supporting NET3
(1.1.5 and higher). This is the first generally available ALPHA release,
and there are some restrictions, explained in the README.

If you are unfamiliar with the Ottawa PI2 synchronous interface card
for amateur radio, send mail with any subject/body to:

pi-info@hydra.carleton.ca

The latest driver versions (currently at 0.5 ALPHA) are available
for anonymous ftp from from hydra.carleton.ca, in

/pub/hamradio/packet/tcpip/linux

I don't have any idea why it is freezing up. I tried it, and it did the same for me. The only other thing that I can think of is going through the front door and giving the command to go into conference mode. I don't know how to do that on that particular system though. If it's that important try leaving a message to the operator to see what's wrong with it.

> could tell me how it is done?

The way this is done is by feeding the baseband video output from
the satellite receiver into the HF receiver. Note that the HF rcvr
must be set for FM mode. By tuning across the video signal in the HF
range you will find all kinds of specialty narrowband signals, including
RTTY and WEFAX. I'm not sure of the exact frequency on Spacenet3 but
perhaps someone else out there does. Try all the transponders, though.
You'd be amazed at what you might come up with.

See the ARRL "Spread Spectrum Handbook" at your local radio store. I'd also snoop around to see what's available in IC's these days, given the great interest in SS for consumer products. If you have $$, take a look at the Unisys EB-100 programmable SS evaluation system (board), e.g., as shown in Signal, Vol. 48, No. 7, March 1994, p.26. You may also want to touch bases with Bob Buaas, K6KGS, who is the PI for an STA for SS experimentation (fax 714-968-6781). Good luck. And please post you findings here. Thanks.

1195. Moving digital image data from mobile van to hospital

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-21 21:22:31 UTC
From: dtucker@Erebus.rad.uab.edu
Message-ID: <1994Apr21.212231.22003@cis.uab.edu>
Source record: 49390

Several months ago the radiologists in my department started providing a mobile radiography service. The service is provided in conjunction with another company that obtains the images, and the docs here read the films for a fee. To date, the way this works is a portable radiography unit is transported to the site (nursing home, outpatient clinic, etc) where an image receptor (called an IP) of a Computed Radiography (CR) system is exposed. The IP is returned to our institution where it is processed using dedicated equipment in a conventional manner. The film is then interpreted by a radiologist.

I was approached with the following question: can the device which is used to extract the information from the exposed IP (a CR reader) be placed into some type of vehicle and be used in a mobile environment. In this setting, the CR reader and the radiographic equipment would be transported to the site. At the site, the IP would be exposed and processed by the CR reader, with the resulting digital image data set saved on a associated computer system. The data would then be transmitted back to the department for processing. The hope is to reduce delays, etc, etc.

The question that I have for this group is, provided all of the other issues are worked out, how to get the data from the van back to the department in an efficient and cost effective manner? What options are available? I have read several of the posting in this newsgroup, and am wondering if "packet" would be appropriate. For this application, each image will be approx 8MByte, with 3-5 images / hour.

Thank you for your help.

1198. Running Pactor and GTOR on the Same BBS Port

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-22 02:25:49 UTC
From: ag807@cleveland.Freenet.Edu
Message-ID: <2p7cjd$ah9@usenet.INS.CWRU.Edu>
Source record: 49393

SB HF @ WW < NO8M $62887_NO8M
Both Pactor/GTOR On BBS Port (1/2)
R:940420/1604z 62887@NO8M.#NEOH.OH.USA.NA

RUNNING KAM PACTOR AND GTOR ON THE SAME BBS PORT

Real time observations have shown that GTOR is twice as fast as Pactor on a 80 meter path. Although we have not been able to check the performance from different locations (but will from many locations soon), it is apparent that GTOR will be superior to Pactor.

The availability and popularity of Kantronics TNCs is quite limited outside of the United States. BBS support of both Pactor and GTOR would be an advantage. In fact, until some further support of GTOR is made by equipment suppliers shipping outside of the United States, Pactor has to be supported.(1)(2)

(NOTE 1: Not all people have Internet or a good VHF support network. I have many DX stations who use the BBS who do not have access to the Internet. Contrary to what some people (those who are opposed to HF forwarding) would like you to believe, transferring information to South America via VHF nodes is not quite possible yet.)

(NOTE 2: It appears that a number of BBS software packages will offer support for GTOR. None have been released yet although one is obviously in beta.)

Two KAMs were run in parallel by running the radio port lines in parallel. Running these to a Kenwood TS-450 showed that dual porting will not work in the FSK mode. The KAM uses a simple transistor switch to hold the FSK line low unless a toggle is required. Rather than reverse engineer that, a change to AFSK was made.(3)

(NOTE 3: Two virtually identical HF MSYS BBS systems were tested over a long period of time from many locations under many conditions. One system was operated with FSK and the other with AFSK. If there was a difference between FSK and AFSK, it was so slight that it was not measurable. AFSK is fine.)

Once the radio was run to the two KAMs, an immediate problem surfaced. Pactor operation on 3632.1 Mhz. (which is 3630 mark to a FSK radio) worked fine. A switch to Pactor showed the radios were not tuned to the same frequency.

/EX
SB HF @ WW < NO8M $62888_NO8M
Both Pactor/GTOR On BBS Port (2/2)
R:940420/1604z 62888@NO8M.#NEOH.OH.USA.NA

After a bit of experimentation and calculation, we came up with the
following two setup files for the TNCs.

For the GTOR KAM: For the Pactor KAM:

<control-c>x <control-c>x
<control-c>d <control-c>d
<control-c>d <control-c>d
pbbs 0 pbbs 0
intf term intf term
xflow off xflow off
flow off flow off
crsup off crsup off
prekey 0 prekey 0
pthuff on pthuff on
pmode gtor pmode pactor
delete 0 delete 0
echo off echo off
gterrs 80 space 2295
space 2295 mark 2095
mark 2095 shift modem
shift modem pactor
gtor

Now either KAM can seize the radio and respond.

THE IDEAL NEXT STEP:

It seems like all the pieces are in the KAM to allow it to
recognize a connect from any HF mode. Whether it has the
horsepower to do that kind of operation may be the problem. Using
the GSCAN function, an external program could be written to monitor
the port, determine what flavor of connect is coming in, and set
the TNC to that flavor. It could then assemble packets and feed a
BBS program some sort of Host or KISS mode information.

With XT systems going for $100, it may be possible to dedicate such
a box to doing this function. Use the XT to do the external
codework that the KAM, now used only as a modem, is feeding it.
The XT would then feed the BBS the resultant frames.

Finding someone dedicated to writing such a function is the only
remaining obstacle.

1199. Msys and mfj w/2.1.9 firmware

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-22 05:01:42 UTC
From: stu@ash.lab.r1.fws.gov
Message-ID: <2p7lnm$5rh@ash.lab.r1.fws.gov>
Source record: 49394

We have an interesting problem that I wonder if anybody else has noticed or solved. First, we have a 1270B with a 2.1.9 firmware ROM and as a normal tnc, it works fine. We can connect to other stations, etc.

But when we load msys and execute it, the tnc won't connect. Msys puts the tnc in KISS mode and sometimes a monitoring station (JNOS) can decode the packets. Sometimes it can't...

If we swap out the ROM with a KISS EPROM, all works fine. Is there something wrong with the KISS firmware in the 2.1.9 code?

Thanks

1201. Building a Satellite. Need Advice.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-22 06:44:19 UTC
From: rbatra@leland.Stanford.EDU
Message-ID: <2p7ro3$iok@nntp2.Stanford.EDU>
Source record: 49424
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc

Hi All,

I'm a Stanford graduate student in the Aeronautics program and
am building a satellite that will be launched hopefully sometime next year.
I plan on using a TNC for telemetry data. Since the majority of the
satellites use PSK, I plan on using a rad hard version of a paccom tiny 2.
I hear they use low power (CMOS) and are easy to hook up to a transceiver
(as opposed to 9600). First, are my decisions sound?
The satellite will be in LEO, and we do plan on downloading jpeg pics
(about 20K each). 8 - 15 minute windows.
Second, what can I do about data integrity? I hear there is a
protocol called pacsat that the uosat's use- is this an easily configured
code (we plan on launching a 68332), and if so where is it available.
If there is a better/easier protocol available let me know. My major concern
is to resume a download if the window is not long enough to retrieve a
picture.
Third, using a store bought TNC 1200 baud, will I have any problems
uploading. Will Doppler's effect be a problem?

Thanks in advance,

Rajesh Batra

More deleted...

FCC type approval is even more meaningless in the UK!!

However It should be noted that Just about everything in my house throws out rf noise. Even my Psion organiser.

I used a friends ICR1 to trace mains cabling in my house because I

accidently discovered that my mains radiates noise on about 120MHz!!!

Acually in all honesty I think that the ICR1 was capacitively coupling into the mains and using it as an aerial. Thus rasing the received noise floor. Who knows?

As to my 486. Well I just try and keep my aerials as far away as possible.

Have fun.

|>
|> By the way, is there a Hostmode eprom which can also do KISS ?

According what I wrote to richard_smith@nrl7350.nrlssc.navy.mil (richard smith)

----------8<----------
richard smith writes:
> Hi There.. Tnx for the information. I tried ucsd.edu and found the

OK, I tried 'archie'. After looking around a quarter or so, I found following:

Host ftp.funet.fi (128.214.248.6)
Last updated 04:32 8 Apr 1994

Location: /pub/ham/packet/eproms
FILE -rw-rw-r-- 15742 bytes 03:00 28 Nov 1992 tf23pk88.zip

Location: /pub/ham/packet/misc
FILE -rw-r--r-- 20874 bytes 03:00 19 Oct 1991 tf23.lzh
FILE -rw-r--r-- 128680 bytes 09:51 4 Oct 1993 tf23src.zip
FILE -rw-r--r-- 30998 bytes 09:50 4 Oct 1993 tf24a.zip
FILE -rw-r--r-- 30956 bytes 09:50 4 Oct 1993 tf24c27.zip
FILE -rw-r--r-- 16256 bytes 13:07 27 Dec 1993 tf26_10.lzh

I ftp'ed tf24c27.zip, and it looks like this contains documentation
along with eprom code. However, it is packed by pkzip 2.0 so that my
(public) unzip decode under unix cannot unpack it.

tf23src.zip looks like a source code - but I don't think that the
compiler and assembler are part of this archive.

[snip]

If you cannot fetch tf2*.zip from ftp.funet.fi or whereever, give me a note
and I mail it to you. Just do the same if it happens, that this isn't the
right eprom (but I don't think that any TNC1's are supported in 1993)
and you need the eproms I use at home.

----------8<----------

If it dosen't help you, I can fetch my configuration at home and make
it available via public ftp. But I only do it by request.

Note that I have the complete source code of
Nord><Link TheFirmware and Nord><Link TheNet, too.

However, TheNet is not up to date and does not contain DAMA.
TheFirmware contains DAMA and those tree modes:
WA8DED, HostMode and KISS/SMACK. SMACK is the KISS mode with
Checksum-Extension mainly used for WAMPES nowadays.

I also run TOP (The Other Packet), which is written in Turbo Pascal
and contains many features like:
Macros
RUN-Directory
AutoBin
AutoBoxBin (for DieBox)
TFPCR/TFPCX support

On request I can put it in public FTP, too.

But please request by e-mail what you want!
I don't want to fill the FTP server with unneccesary data.

Distribution: world

As a courtesy to visiting hams at the Dayton Hamvention.
There is a posibility I may provide some internet access from the Hamvention
floor. I plan to request the partial use of a phone that can connect to a full
internet node. you will need your site IP # if you wish to telnet to your node
to check your email or check on the family. This site is part of the
DMA is another non-profit organization not quite aas the sponsor of Hamvention that
has a ComputerFest in the fall the weekend before the Labor day weekend. It takes tthe
whole Hara Arena.. since we are not quite as Hamvention yet the parking lot is
used for parking not a flea market. anyone interested in that please call the
DMA information line (513) 848-6DMA or email to kwaterb@dmapub.dma.org o
or myself for further information. If I can get the ok from the Forums Chairperson
Ron Moorfield a terminal with modem may be available for some limited use.

I plan to be working the show at the Speakers & Forums table... last year that
was near the conferrence rooms area. For those interested in doing a
CQ WPX MultiOperator SIngle Transmitter COntest Station with a contest QSO rate
of 300 per hour max that could be sustain over a 48 hour contest period
if there were enough WPX to keep it busy that would be a total of 14.4 qso
contacts.. the premise is to win by sheer volume of 14,400 as a goal.
You can then use the multitplier on lets say 60% of the 8,640 will give you a
decent score. So anyone interested in particiapting in am impromtu meeting
contact me via email, at the forums speaker table or call me at 643-2724 (513)

hope to see you at the Hamvention

Definitively not. Check out KERBEROS, the Berkeley TCP/ip extension found in
BSD compatible Unix(tm) systems like BSDI etc.

However, KERBEROS is protected by american law and the supporting DES
hardware is under export restriction.
But DES is freely available here in Europe and in the rest of the
world, because algorithms can only be patented in US.
Running KERBEROS without DES hardware would be a bottleneck and slow
down the machine too much, because KERBEROS is designed to work in
Ethernet speed ... So KERBEROS is very interesting, but I don't know
any place where it is used.

|> without getting some kind of crypto gear. (Beware of the DES trap; DES

There is no HAM implementation AFAIK. But there is no problem to
interconnect two Systems protected by KERBEROS over two Packet Gateways.
Richard wrote about "commercial" frequencies, so crypted signals should

be no legal problem.

I am wanting to build a packet system from scratch.
I need information on the following:

packet modem ic's
packet schematics
packet protocol
packet etc. software for PC

I am presently going to experiment with the AMD 7910 Modem ic.
I would like to know about some newer modem chips, especially
useful for packet radio.

I am also interested in getting setup for direct satelite communication.
I need info. on that, and tracking software.

If anyone can help me, I would appreciate it.

thanks,

Parker

We were presented with a similar problem several years ago. It involved remote clinics in northern Canada transmitting x-ray images to two hospitals in Montreal and Toronto. At the time, it was determined that the images could be compressed to 3 MBytes, but even at that we needed a T1 line to the sites. At 40 Mbytes/hour, it sounds like you would still need the same thing, unless you could do it via microwave. I'm not up-to-date on commercial uses of packet, but here even 9600 baud tends to be a stretch, and that wouldn't be nearly fast enough.

I've tried to email you, Richard, but it bounced. If you're simply going
to use packet style tncs and radios to carry the info on commercial
frequencies, AEA had a commercial version of the PK-87 that encrypted the
traffic. That sounds more like what you had in mind.

Is microsoft going to try to have an API for everything? Next it will
be MSDOS for DSP.

Or perhaps a ham receiver control API? Hummm, maybe not a bad idea!

Hi All,

Is there an AX.25 library available? I would like to send down my
data through a library which would create an AX.25 packet and then either
return this information to me so I can pipe it through the serial port or
have it do that for me. I would like the source for the 68000 series
or in C.

Thanks in advance,

Rajesh Batra

Hi there, thanks for taking the time to read this.

I am a student in London who wants to send packets (as in mail) to my friends at home. Does anyone know anybody who can forward my mail on and off the packet net. IE: I packet BBS which I can use through internet. If anyone can help it would be most appreciated. The BBS can be anywhere in the world, EMail address'? Telnet address'???

Any help will be much appreciated.

GW0TJO a.k.a. redvers.davies@ucl.ac.uk

P.S. I will mail copies of my licence to anyone who needs it to prove I am licienced.. Thanks again.

>spec - software implementationsof DES are dis-allowed!).

Pay no attention to the hardware-only requirement of the spec unless
you're trying to sell to U.S. government. No one else cares. For
anyone else, the issue is simply this: if I put in clear text, do
I get cipher text out that matches what DES specifies I should get?
If you do, it's DES.

Anyway, even if you sell to the government, the hardware-only issue
gets pretty silly when some vendors simply "black box" a micro or
bit-slice processor with a software (or microcode) implementation of
DES in ROM and call it hardware.

Hello.

Thank you for reading this posting.

I need help in getting a KAM (or KPC4) connected to my Icom W2A
dual-band handheld.

I have a cable already made up that allows me to transmit but I am having
tremendous difficulty finding a configuration that will allow me to receive.
The problem only exists when I try to use the KAM-W2A combo on 2m. The
system seems to work OK on 440 because the PTT line goes to jack SP1, while
the audio is taken from jack SP2. (This is not possible on 2m, though.)

Although specific instructions are desired, any general advice is also
welcomed. Please respond by internet e-mail to RUMBALJ@GOV.ON.CA.

Thanks, in advance, for your help.

Hi. A friend of mine has just purchased a Paccom 1278 TNC and he's looking for the places on the HF bands where he might find some packet activity. He doesn't know what it should sound like so with the freqs at least it'll make it easier to spot them.

Any info would be helpful. I have a setup on VHF, but I never operated HF packet so I can't really advise him myself on this.

1233. A soft spot in the Pactor protocol???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-25 16:33:40 UTC
From: greg@netcom.com
Message-ID: <gregCotq05.DEy@netcom.com>
Source record: 49425

I'm fairly new to Pactor, but in observing the behavior of the
mode on 80M, I've observed something which is kind of interesting.

Occasionally on my own and on monitored QSOs, something disrupts
the connection (which I understand is precisely what Pactor is
supposed to get around, that is unreliable links).

Then what seems to happen is that the two stations continue to transmit
blindly, and the 'sending' station eventually times out, causing the
need for a re-connect.

Basically what *seems* to be happening is a total loss of synchronization,
with neither station shutting up long enough for the link to get back on
track. After a re-connect, things proceed smoothly.

Another anecdotal observation (which may be entirely a factor of the
sample being skewed): it seems most often to occur between two PK232
controllers.

Is there any 'link recovery' protocol built into Pactor which should resolve
this, or perhaps a tnc parameter setting that has been undocumented or
overlooked? It strikes me that what sometimes happen is rather analagous
to the packet collision problem, and might be avoided in the same way.

Or is this a 'hole' in the protocol?

Greg

Dino, tell your friend to listen between 14.094 and 14.110 Mhz. Most
of these stations are closed BBS stations handling traffic but 14.103
is used for calling and QSO's. Also look around 7.095 to 7.110 and
21.095 to 21.110.

Contact HH2PK@HH2PK. Patrick has been extremely active on networking Haiti. Between the lack of gasoline (due to embargo) and other attendant problems, I have lost track of his current progress. It is hoped that a KAM+ and some GTOR may be in their future.

From the U.S., a general class license, HF radio and fairly simple antenna will get you into the area 12 hours a day digitally.

1238. HELP MFJ-1274 & Icom 2-SAT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-25 22:21:47 UTC
From: au919@yfn.ysu.edu
Message-ID: <2phfpr$m0u@news.ysu.edu>
Source record: 49434

I am having a problem getting my new MFJ-1274c to work with my
Icom IC-2SAT handheld. It seems to receive OK, and it will key
the mike and send a carrier, but doesn't transmit the modulated
packet signal. With a speaker connected to the TNC I can hear
the TNC generate 'packet racket', but on a separate receiver I
don't hear this 'racket', just the mike being keyed. I have
'jump L' installed but am thinking I want to put the capacitor and
resistor in the cable instead. Should I use the same value
capacitor as is on the MFJ board? Or is this the source of my
problem (i.e. I need to use a different (smaller) resistor)? Or
do I have a defective unit?

Any suggestions or opinions would be appreciated.

Cleaning up the shack. I have two PSK modems for sale, as I
have switched to a DSP-2232.

....
PacComm PSK-1 modem.

Interfaces to a TNC-2 modem disconnect header, and to many
other TNCs with a bit of work.

Suports 1200 baud PSK, as used on AO-16, WO-18, LO-19, FO-20,
and IO-26.

Decodes 400 baud PSK as used by AO-13 telemetry.

Includes all original cables, connectors, manual, and separate
RS-232 cable used for 400 baud telemetry. No power supply, but
uses a standard wall unit. Excellent condition.
$75 firm, including shipping.
....
TAPR PSK modem.

Interfaces to a TNC-2 modem disconnect header, and to many
other TNCs with a bit of work.

Suports 1200 baud PSK, as used on AO-16, WO-18, LO-19, FO-20,
and IO-26.

Includes all original cables, connecors, manual, TNC header
disconnect, assembled in a Radio Shack box. Works perfectly,
but in this case, beauty is in the eye of the beholded.

$50 firm, including shipping.

1242. Help ASCII Display Receiver . . .

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-26 12:53:14 UTC
From: mwreed@wsuhub.uc.twsu.edu
Message-ID: <1994Apr26.075138.1@wsuhub.uc.twsu.edu>
Source record: 49369

I'm working on a project to getting some receivers put together
that will have a small display on them (plan ASCII). The purpose
of the receiver is to allow a person that is hard of hearing or
deaf to be able to receive weather bulletins off the weather info
system. The system will be working at 300 baud using the standard
landline modem format. The receiver itself (the rf side) is the
easy part (just modify a regular weather alert radio to the frequency
that will be used). The problem that I'm having is building the display.

It will need to have a storage buffer of some kind in order for the
information won't just scroll away to quickly, and maybe have a scroll
back feature.

Any help and suggestions will be greatly appreciated.

Message-ID: <1994Apr26.151137.6512@midway.uchicago.edu>
Source record: 49432

I operate BMKMULTY software PacTOR emulation and have observed exactly the same conditions. It seems to happen to me when I am connected to a PK232 station. Band doesn't matter, happens on 15 and 20 and 40 fer sure. Most often I loose the connection due to severe QSB where the sig simply disappears. I hoped that the addition of a good DSP based filter might help (?) BMKMULTY has a time-out parm that is set to a few seconds. If the link is lost I get a prompt disconnect and simply try again with F1 (connect).

I thought it was my BMKMULTY setup :-) and was about to invest in a PK232 or KAM. Any suggestions welcomed.

That's true. Anyone interested in *authenticating* the
message must have a securly obtained mapping between originator and
public key. My purpose in suggesting the inclusion of the public key
in the message (in the clear) is to allow monitoring by those who
haven't hooked up with a key server. The idea is to take away any
arguement that the encryption may serve to intentionally obscure the
meaning.

1248. TNC emulator for ATARI portfolio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-26 19:26:06 UTC
From: durocher@CIM.McGill.CA
Message-ID: <2pjpse$69h@Ice.McRCIM.McGill.EDU>
Source record: 49367

Does anyone have a small tnc emulator (baycom?) that would fit into
a 128 kb ram card of an atari portfolio and run within 256kb of RAM?

I am building a small baycom modem for AX.25 packet on 2m and would like
to use my Atari Portfolio with a serial interface to create my first
and portable packet station.

P.S. The Atari Portfolio uses a derived version of msdos 2 or 3.XX
I would require a compiled version if possible.

Thanks in advance!

: -Thomas
: N3HAU

I'd say it depends a lot on whether you make the service public or not. When you use the AX25 drivers in the kernel, as I understand it, you have no ability to set controls on what services or ip addresses pass from one port to the other. JNOS implements TCP and IP access controls. I've not tinkered with area yet, as my linux box is on a local ethernet with a jnos box handling the radios. However, for license preservation, look carefully at how much control you may need to exercise over non-amateurs attempting to use services or access stations on the air. The FCC is not in favor of unlicensed operations!

: RUNNING KAM PACTOR AND GTOR ON THE SAME BBS PORT
:
: Two KAMs were run in parallel by running the radio port lines in
: parallel. Running these to a Kenwood TS-450 showed that dual
: porting will not work in the FSK mode. The KAM uses a simple
: transistor switch to hold the FSK line low unless a toggle is
: required. Rather than reverse engineer that, a change to AFSK was
: made.(3)
:
It is possible with a few transistors and diodes (or horrors >relays<) to
make a switching circuit that only passes FSK data from the TNC that
activates its PTT output. This does require routing both PTT and FSK
signals from both TNCs through the circuit, with outputs consisting of a
switched FSK signal and a PTT signal for the radio. I ginned one of these
up on a super-strip about a year ago to verify the functionality, so yes, it
does work.
: (NOTE 3: Two virtually identical HF MSYS BBS systems were
: tested over a long period of time from many locations under
: many conditions. One system was operated with FSK and the
: other with AFSK. If there was a difference between FSK and
: AFSK, it was so slight that it was not measurable. AFSK is
: fine.)
:
Also, with the Kenwood TS-450 and TS-850 and AFSK operations frequently
seems to result in RF feedback - completly avoided when switching to FSK.

From: forrerj@frl.orst.edu
Message-ID: <forrerj.29.0@frl.orst.edu>
Source record: 49439

Hi DSK users,

I have been playing with Tom Sailer's (HB9JNX) RTTY/AMTOR/PacTOR programs for the past few weeks and its really a lot of fun. It uses a DSK for implementing HF DSP modems and is a self-contained package for PC compatibles. The DSK does demodulation and also generates AFSK tones for any tone/shift pair you like - the PC does most of the bit assembly and user interface. The program includes an on-screen tuning display in addition to an extensive built-in modem control program that shows real-time FFT of the receive passband, cursors to identify the tones, and options to let you select your own tones/shifts - actually, lets you design your modem. And it really works very well.

I also have beta code that Tom provided me that does 2DPSK and 4DPSK for HF digital as well as an experimental HF mode he calls "JNXTOR" - it uses n-ary PSK and convolutional code (much along the lines of PacTOR II). Shows what is possible in DSP.

I have uploaded (with Tom's permission), the FSK version for RTTY/AMTOR/ PacTOR to UCSD.EDU in/pub/hamradio/packet/tcpip/incoming/dskjnx1.exe (+ dskjnx1.txt). This is freeware - thanks to Tom for sharing his work.

Enjoy,

Johan Forrer

```
TheNet X1J Release 2 packet Node software.
==========================================

I have just uploaded the latest release of TheNet X-1J Release 2
to :-

oak.oakland.edu /pub/hamradio/incoming

Dave (G8KBB) and myself (G0JVU) have been beta testing it for a
few weeks with a selected few sites around the world.

This release includes several new gadgets for X1J node operators
and users.

The node now supports four Analogue input ports:-

Port 1 is for the previously announced Deviation meter
Port 2 is for the new Signal strength meter addition
Ports 3 & 4 are general purpose input ports.

I have used port 3 for a temperature sensor and port 4 for a psu
voltage monitor in my local test nodes. I have included a document
(in MS WORD format) called HOTNCOLD.DOC for anybody who wishes to
attempt to add the temperature sensor to the node.

I would be happy to hear of any other uses these ports get used for
around the world.

There will be no PCB this time! Especially as ports 3 & 4 are user
defined!

Best of luck with the product.

1256. Internet -> packet gateway legality

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-27 01:55:09 UTC
From: jka@ece.cmu.edu
Message-ID: <JKA.94Apr26215510@mustang.ece.cmu.edu>
Source record: 49341

I posted a question to rec.radio.amateur.policy about the legality of internet->packet gateways and got a few replies. Anyone here have an opinion?

Recently, I asked:
> A local amateur radio operator recently complained about my use of an
> internet to packet gateway, asserting that such a gateway constitutes
> use of the amateur packet network by non-amateurs. I am a licensed
> amateur, but that's not the point. I assume that someone has worked
> out all the legal technicalities of these gateways. What should I
> tell this guy to make him leave me alone?

Thanks for the email and posted replies so far. A few points:

> Tell him two things:
>
> 1. It is just like any other third party traffic; and

One of his complaints, and the reason he brought it up in the first place, was that the originator of the message was GATE instead of a valid callsign.

> 2. It is really none of his business.

Well, that's never stopped ham radio operators before. Anyway, it's his business to the extent that packet mail from this gateway gets routed through his node.

> His complaint is with the owner of the gateway, not you. I assume he
> doesn't own the gateway himself. It is also the gateway owner's
> responsibility to see that it is used legally, so if the owner lives
> up to the legal requirements, the complainer has no complaint.

Understood, but I was hoping to resolve this without troubling the gateway owner-- after all, he's doing me a favor by running the gateway.

In looking into this a litlle more, I find that unlike AMTOR, PACTOR
has no reconnection protocol. So the link has to effectively fail completely
in order to be re-established. This can be hastened if both stations listen
to the traffic, and drop carrier when it becomes clear that no more data
is passing over the link. The link also takes on an 'out of sync' sound
that is hard to describe, but quite distinctive.

It would seem that some protocol enhancment which defines what to do when
the link gets shaky would be a real boon to PACTOR. One suggestion might
be to slow down and try to re-establish syncronization through an
effective re-connect, and via remembered status, continue the contact.

It's almost as though the 'packet collision' problem has been brought
to what is in many ways, and AMTOR, link, with no provision to deal with
such collisions caused by the two stations themselves.

Greg

This seems incorrect. It is my understanding that the PK232MBX units
do not require the daughterboard (which is to effectively convert
a PK232 to a PK232MBX). Did you specify your model and serial number
in your correspondence with AEA?

If so, is it possible that either you or they have misunderstood what
is required?

Greg

1263. Are TNC schematics/kits available?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-27 16:49:39 UTC
From: riyadth@boi.hp.com
Message-ID: <CoxG2r.IJ8@boi.hp.com>
Source record: 49347

Hello,

I've been wanting to try packet radio for some time now, but I haven't got around to actually buying a TNC yet. I know that there are other alternatives (BayCom-type modems, for example), but since I run an Amiga, and hope to use a Unix-based system in the near future, I would like to use a 'standard' TNC. Speed is not as important as actually getting started.

Rummaging through my junk-box, I think I have enough parts to get a good start on a TNC. At least the digital portion. What I would like to know is the availability of TNC schematics, kits, or (preferrably) bare circuit boards. Having seen various types of firmware available (plug and play for TNC-2 compatibles), I feel that the specs for the TNC-2 hardware must be available other than through reverse engineering.

Any help would be greatly appreciated. Thanks very much.

1264. PK232MBX & PAKRATT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-27 21:06:37 UTC
From: jcaradim@gr.oracle.COM
Message-ID: <9404272106.AA29176@GRSEQ1.gr.oracle.com>
Source record: 49379

Hi everyone,

I own a AEA PK232MBX, bought about a year ago from Germany. The device is working OK, but it doesn't have PACTOR. Some friends told me that all PK232MBX can be upgraded to cover PACTOR, by swapping the two EPROMs, in them with some new ones that AEA has.

I send a letter to AEA, asking for info. The AEA folks, very kindly answered, but their solution was to buy a daughterboard from them, which costs about 110US$ and adds PACTOR (plus some other functionality relating to the mailbox) to the unit. Now, considering that I bought the device for 420$ (street price, not anything special), I think that this is too much. If I was to pay this money, I could as well sell my PK232, add the 100$ and get the new PK900 from AEA, which has more functionality (and is newer and glows beautifully in the dark).

Can someone tell me, if the first solution I heard, is possible? If it is, does anyone have the part numbers for the EPROMs?

Many thanks

Best 73 de SV1CEC

1265. Re: AEA's new 9600bd TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-27 21:47:05 UTC
From: mead@hamal.usc.edu
Message-ID: <2pmmgp$3me@hamal.usc.edu>
Source record: 49352

I have a couple of the new AEA PK-96 1200/9600 TNC's. While I haven't done any exhaustive study, I can offer a little info based on my use.
The PK-96 is a smaller box than the MFJ 1270. The radio interface is a single 5-pin DIN, with separate TX level adjustment controls on the rear apron. I notice less interference from these TNC's than I experienced with MFJ-1270's. The firmware is much like the current PK-232, with EXpert mode. In fact the book seems to have been a re-write of the PK-232, as some info relates to that box, not the PK-96. So far my only complaint is DCDConn does not seem to work in KISS mode as advertised. That is, the DCD pin-8 signal to the computer does not seem to follow the DCD on the front. I have asked AEA about this but no answer yet.
I have interfaced the box to a Kenwood TM-221A and TM-421A 2Mtr and 440 rig. I made direct connects to the MOD and DISC points for FSK use with 9600 baud, and find 1200 works just fine also. Drive level seems quite adequate, an internal jumper sets High or Low range, and is common to both 1200 and 9600.
All-in-all, I am happy with the box. Oh, baud rate is changed by the HBAUD command, but you then have to adjust any other settings such as TXD, as all settings are also common.
Ah yes, also true DCD state-machine, for open-squelch operation.

I just ran across a program on Compuserve that is not-so-humbly billed as
the best packet program ever. It is called "PAKET" and it is very, very good.
Since it is shareware, give it a look.

Brian Kantor (brian@nothing.ucsd.edu) wrote:

: Frankly, I do not believe that the existing e-mail addresses used on the
: AX.25 BBS network will ever change. I do believe that a parallel
: network of internet-compatable ham radio mail servers will spring up
: and, over time, obsolete the AX.25 BBS systems.

You are correct. We're doing it in Buffalo, and in
Pittsburgh... This system for example allows for messages to go from
ampr.org to Internet. In time it will also be a wormhole... But I
need to replace the dreaded UUCP Internet link with something
substantial.

: The issue, for the moment, is how to make the two systems (the Internet
: and the existing AX.25 BBSs) interoperate as best they can.
: - Brian

Simple... RSO... Get rid of DOS, run Linux, and get on with
life. Sorry to sound so incencitive, but that's what works... And
it's the only thing that works 100% of the time. Rather than having
KA9Q or it's variants emulate the functionality of TCP/IP (dare I say
UNIX) networking, let Linux do it... It's inherent in the OS... No
patches, no band-aids. And it's wicked fast as well.

Heck, if everyone ran Linux we could (albeit it would be like
sucking the great lakes through a straw) run graphical applications
via radio. Something like X-Trek, or something else similar.

Some say it'll never happen. I say it will happen if people
wise up. DOS is now about 14 - 15 years old. It was meant for an 8
bit processor, 1 task, and that's it! I like to say DOS is like a
bicycle, and UNIX is like an 18 wheeler.

The 18 wheeler makes the most out of it's horsepower, and
payload, and it has air conditioning, power windows, power brakes.

They've taken the bicycle, and added a 500 horse power motor,
3 gear ratios (Windows(tm) Standard Mode, 286 Mode, and 386 Mode), air
conditioning, power windows, and power brakes, maybe even power
steearing.

The analogy is it's still a bicycle frame. Let's look at what
was added on to DOS.

o Memory Management (640K barrier still exists)
o Networking (Still quite limiting as you can't do much gatewaying)
o Graphical Applications (Windows)

o Multi-Tasking

I'm sure there is more. But the backwards compatibility
nipped them in the end.

I'd rather go with Platform Independence than backwards
compatibility. Just re-compile the applications! Done deal!

When I migrated from Xenix(tm) to Linux I just re-compiled,
and it was done! How hard is it to type "make install" in the source
directory?

In short, your chain is as strong as your weakest link. And
what has been the main objection to people not getting UNIX?

o It's too expensive!

Now it's free! Get off your DOS rocker, and FTP to
sunsite.unc.edu and go get it! If you don't, and you still suffer
from DOS woes, I have no sympathy...

Why do you need to run DOS?

o Spreadsheet? It's in Linux
o Database? It's in Linux
o WYSIWIG Editor? It's in Linux
o Fax modem? It's in Linux
o Novell(tm) compatible? Have them run Linux, and not a
band-aid.
o Multi-Tasking? It's in Linux
o Multi-User? (Oh, wait, DOS doesn't even know about that)
o QEMM-386(tm) (Gee, I'm losing myself here...)
o Windows Environment? It's in Linux... Pick 1,
there is 3 or 4 kinds of
interfaces.
o DOS Compatibility? It's in Linux... DOS emulator.

Now, go get it, and sell tell your broker to sell your stock
in Excedrin.

uptime:

12:33pm up 96 days, 12:52, 2 users, load average: 0.16, 0.05, 0.01

96 days without a re-boot... Not one hiccup! What are you
waiting for?

> opinion?
>

In operating two BBS's (GB7MXM: AX25-NTS[me], & GB7TXM: TCP/IP[my wife]) I believe that our NOVs allows us to handle 3rd party messages. It does not say anything in BR68 (UK licence text) that I must exclude non-amateur traffic if the traffic has originated from something other than radio modes. Therefore running a TCP/IP telephone slip link into say demon.co.uk from our tcp/ip bbs allows us in theory to route internet traffic into the amateur network and vice-versa!

Practically the phone costs prohibit this activity, along with having to pursuade demon.co.uk to route 44.131.nnn.nnn etc to our account.

Also my licence is at risk as the 'gateway' operator. If I pass traffic that is deemed to have gone out of the scope of BR68 then I face the consequences not the originator....

Anyhow, there is nothing in theory that should stop it happening legally at present. However, who has ever known licences to keep pace with developments?

Unfortunately, it is loaded down with both halves of a mobile home (stacked), a 40 foot sailing yacht, 4 cars, a truck, household goods too numerous to mention, a couple of jet-skis and a travel trailer.

Of course, this could just be a religious war....

1288. Integrate HF w/WAN

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-29 16:22:57 UTC
From: mtimpn@baileys-emh2.army.mil
Message-ID: <C90NB9ZT@math.fu-berlin.de>
Source record: 49377

Hi:

I can imagine this would be excruciatingly slow but - does anyone have any amateur or business experience with using HF for WAN connectivity? I'd like to put an HF transceiver at our hub location and provide mobile users the opportunity to at least upload and download files if not interactively log into their home accounts. Any comments would be appreciated.

73,
KJ4QF

1289. DRSI DPK9600...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-29 17:08:24 UTC
From: wb9mjn@uugate.wa7slg.ampr.ORG
Message-ID: <74533@uugate.wa7slg.ampr.org>
Source record: 49381

Hi, i ve been using the DRSI DPK9600 tnc here to set up a radio for 9600 baud. It works with my upstairs station (IC471a/G3RUH modem/MFJ1270B) just fine , thru the new radio. It uses a z80, and some custom chips, and the MXCOM MX489 single chip .5GFSK modem. That s techno speak for K9NG modulation or what the 2 way radio advertiseing people now call DGFSK or is it DGMSK? So, altogether, this TNC only has 10 chips! Pretty slick. Radio baud rate it simple, u select 4800/9600/19k2 with jumpers in side the TNC. It has audio input, and output level controls. The input level control was useful this time around. That is, these controls are internal multi turn pots.

Im not sure if its a 10 Mhz Z80 or not. Usually for 19k2, 10 Mhz Z80 would be a minimun for proper operation. It is also using the same Z80 SIO as the TNC 2, so maybe, and this is a BIG MAYBE, its TNC 2 code compatible. And NO it does not send the tx audio continuously, during rx. It turns this audio off and on successfully.

Pretty nice unit, on the whole. Probably what one version of the original TNC 2 should have been.

> 96 days without a re-boot... Not one hiccup! What are you
>waiting for?

someone to write the step-by-step procedures needed to blackstart such a beastie w/o having the time to go back to school to become a unix gooroo.

spec ALL the parts used and where to get them. "make install"? i didn't get a "make" with my copy of DOS (or a C compiler for that matter..). include workarounds for things that may not go right. be available to help guide folks into and out of things that may be bad/good with the program.

73 would probably buy it. last time i did something for them it was like $50/page. could be the seminal work for this idea...especially if you can show how to do things like dual boot to other systems including ol' DOS and OS/2. maybe it'll even be a monthly column...

probable target system:

386sx16 with 4 Mb ram and a 40 Mb disk. VGA display. a couple of com ports (1 with mickeysoft mouse), etc.

>computer. Is the software for this type of modem available for the MAC?

Yep, as Terry mentioned, SoftKiss will drive packet modems. And my
program (Savant) will speak with SoftKiss (or any TNC in KISS mode)
and provide a nice Macintosh interface for packet radio. You can get
SoftKiss as well as a demo copy of Savant via anonymous ftp from:
cpre1.ee.iastate.edu:/pub/ke0ph/

>Also, he is having trouble hooking the modem up to his Kenwood TH-78 HT and
>would appreciate any pointers on getting that to work correctly.

Kenwood's use a different PTT method than others. As I recall you
have to connect between the sheilds of the input audio and earphone
jacks. You can try it with a screwdriver to be sure. Then it just
takes a slight modification of the modem to tie those two points
together through the output transistor, rather than the 3.3K ohm
resistor.

Thank you for inquiring about the wi_packet mailing list.
A list devoted to the discussion, development and promotion of packet radio in the Wisconsin area. Discussion not limited to traditional "packet", but is welcome on any of the digital modes available to radio amateurs. You do not have to reside in Wisconsin to subscribe or post to the list.

Archives available via sending a message to "listserver@relay.adp.wisc.edu" with the following text in the body of the message:
"index wipacket" - To get an index of the archive
"search wipacket _keyword_" - To search archive for _keyword_
"get wipacket _filename_" - To retrieve a file from the archive

You may join by sending a message to "listserver@relay.adp.wisc.edu" with the following test in the body of the message:
"subscribe wi_packet _your name_"
Please give your given name in place of "_your name_".

Please direct questions to:
Tom Landmann <landmann@facstaff.wisc.edu>

Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

1303. Re:GTOR/AEA

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-01 23:28:29 UTC
From: n7ryw@teleport.com
Message-ID: <n7ryw.15.00177A37@teleport.com>
Source record: 49301

I seriously doubt that AEA or any TNC manufacturer other than Kantronics will ever include G-TOR. It is my understanding that G-TOR is proprietary to Kantronics, and therefore anyone wanting to include it would have to pay for it, if that option was even available, which I very much doubt, as their whole prpose in introducing something proprietory is to make themselves the only source for it. Apple did the same thing with the Mac (and others) while IBM left theirs essentially open. If Apple had done differently, the Mac would have easily taken over from the PC...

Sorry for the bad news, but Pactor ia also very good, and keyboard-to-keyboard, you would never know the difference anyway.

See-Ya-Bye

From: Larry Griffin <largri@delphi.com>
Message-ID: <JI1skAt.largri@delphi.com>
Source record: 49296

Michael Solinas <msolinas@netcom.com> writes:

>If anyone has some experience with APRS and the KAM, please contact me. I
>get an I/O error - the computer doesn't seem to be contacting the TNC.

I've been using a KAM with APRS 4.03, 4.04 and 4.05a with minimal difficulty.
I use the TAPR option when starting APRS. It is a little tricky to make sure
you're on the right stream and using the right alias. I set MYALIAS
ECHO/RELAY. Also be sure to set your UNPROTO path for each port. These have
to be set using CTRL-T so you c
an enter the commands directly to the TNC. As to why you get the I/O error, I
don't really know. If you've been using a program such as KaGOLD or
Hostmaster, make sure they put the TNC back into command mode before they exit.

Use a STEREO submini (1/8") plug in MIC/SP1. Worked fine for me.

Richard, the TEKK radios work great for 9600 bd UHF. I have two of them.
One is used on a TexNet node, one here at home. I know of at least 3 others
that are being used at node sites around north TX and OK. The radio is only
2 watts but works quite well with an amp. Here's the scoop on TEKK Inc.
TEKK INC.
226 N.W. Parkway
Kansas City, MO 64150
(800) 521-TEKK
(816) 746-1093 fax

I don't work for them or have any connection with TEKK.
Oh, when you order the radios, be sure to ask for spec sheet and schematics.
Mine came without either.

I just tried to FTP it but the incoming directory seems to be empty!

If you can't find a file in a particular location, please feel free to
search the 00-Index.txt file in /pub/hamradio. Just perform a search on the
file, and the search will show you where in the directory structure the file
lives.

I try to keep the Index file as up-to-date as possible.

Hope this helps.

Yes, it would be excrutiatingly slow, even assuming that you could get a
license to do it. Why not do it via cellular telephony? It would be faster,
also provide a substantial second benefit, and would avoid the licensing and
equipment hassles.

1314. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-02 14:38:55 UTC
From: mtracy@arrl.org
Message-ID: <89680@mt.arrl.org>
Source record: 49307
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

1316. * HELP - COMMUNICATE TWO COMPUTERS *

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-02 15:26:47 UTC
From: bahram@ccr.jussieu.fr
Message-ID: <1994May2.172334@ccr.jussieu.fr>
Source record: 49309

Hello.

I'm new to this group.
I've some questions. Perhaps you will consider them stupid, but i don't think.

You can respond to me, if you have the answers. I thank you very much.

I'm originaire from a country 'X', I live in the country 'Y' .
I've two computers (DX.2 488-66) in home country 'X' and also 'Y'.
Those two computers runs under UNIX and Dos/Windows.
To communicate the two computers (between country 'X' and 'Y'),
for example sending fax to
my family, mail, doing rlogin..., the cost of telephone between countries
is very high and i can't support it.

My idea is to buy two talk-radio, and connect every radio to
my two computers.

First-Question) Can I do this. If yes, can you give me the kind of
radio that i should buy. The preference a digital radio.
What's the limitation ?

Second-Question) Should I buy an interface card to connect the talk-radio
to my computer. What is his name (a modem card ?).

Probably, some programms and software will be needed to communicate
my computers.

Third-Question) What I need as software. (TCP/IP ?, mail ? ...).

Forth-Question) More information needed.

Thank you very much.

Hi,

I'm working with a Kenwood 450SAT and a PK232 and trying to send
stuff with it, CW, Baudot etc etc.. I've made the cable from the PK232
to the 450 using the info from the 450 manual but I'm not sure of the
pinouts. Any body hooked this combo up before?
What pin/color wire arrangement did you use?

The pk232 is receiving data ok and displaying but when I transmit it
will key the transmitter but I'm not sure if any data is being sent.
ie I can't hear anything but a carrier on a seperate receiver.

Any help would be appreciated. Thanks!!

Larry:

I should have mentioned on the original post. This is a contingency application we are investigating in support of operations in areas where no other communications methods initially exist - usually overseas. I also should have mentioned that I work for an army organization. Its sole use (I belived) would be when no other method of communications exist. Almost anything else is faster. I was asked to look into the possibilities because I'm the resident ham in the IM plans division.

I assume that either mil-std parallel or serial tone modems are available
to your organization. Don't a few US government agencies use either an
X.25 variant or even TCP/IP over HF using these types of modem?
Add ALE to increase the link reliability, and it might work fairly well!

just a thought.

John Rumball (rumbalj@govonca.gov.on.ca) wrote:
: Hello.

: Thank you for reading this posting.

: I need help in getting a KAM (or KPC4) connected to my Icom W2A
: dual-band handheld.

: I have a cable already made up that allows me to transmit but I am having
: tremendous difficulty finding a configuration that will allow me to receive.
: The problem only exists when I try to use the KAM-W2A combo on 2m. The
: system seems to work OK on 440 because the PTT line goes to jack SP1, while
: the audio is taken from jack SP2. (This is not possible on 2m, though.)

: Although specific instructions are desired, any general advice is also
: welcomed. Please respond by internet e-mail to RUMBALJ@GOV.ON.CA.

To use 2M on a W2A you need a 'stereo' mini-phone plug. The third
connection is the receive audio. If you give Icom customer service a call,
they can FAX you a diagram. Also, if you desire to operate both bands (one
at a time, of course) you could extend the receive audio line out the back
of the TX connector, and put an in-line mini phone jack in the wire. Then
you can either 1) plug directly into the radio for 440, or 2) un-plug from
the radio and plug into the in-line jack for 144.

: Thanks, in advance, for your help.

Correct me if I'm wrong, but isn't HF illegal under ITU
Conventions for intranational land mobile use?

1323. NET_Mac2.3.40.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-03 07:13:38 UTC
From: adam@gg.TNO.NL
Message-ID: <9405030713.AA01673@iggcis1.igg.tno.nl>
Source record: 49315

```
The Netherlands, May 3, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.40.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Added 'chat' command
- Enhance syntax-checking for 'IP-number'-style parameters
- Make sure the mailaddress looks like: ...%...%...%...%...@...
- Improved the generation of From addresses for hop-to-hop

This release also includes a new NET/Mac Syntax DA.

This version obsoletes all versions of info-mac/comm/net/radio-netmac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
1) ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

It may have also been uploaded to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

1328. New FCC rules on forwarding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-03 15:37:28 UTC
From: w6swe@w6swe.tapr.ORG
Message-ID: <66@w6swe.tapr.org>
Source record: 49320

The FCC has finally released the text of the Part 97 changes relative to message forwarding. According to an article in the April 26 ARRL Letter, the new rules are:

97.3 Definitions.

(7) Auxiliary stations. An amateur station, other than in a message forwarding system, that is transmitting communications point-to-point within a system of cooperating amateur stations.

(28) Message forwarding system. A group of amateur stations participating in a voluntary, cooperative, interactive arrangement where communications are sent from the control operator of an originating station to the control operator of one or more destination stations by one or more forwarding stations.

(36) Repeater. An amateur station that simultaneously retransmits the transmission of another amateur station on a different channel or channels.

97.109 Station control.

(e) No station may be automatically controlled while transmitting third party communications, except a station participating as a forwarding station in a message forwarding system.

97.205 Repeater station.

(g) The control operator of a repeater that retransmits inadvertently communications that violate the rules in this Part is not accountable for the violative communications.

97.219 Message forwarding system.
[Section 97.216 is redesignated Section 97.217]

(a) Any amateur station may participate in a message forwarding system, subject to the privileges of the class of operator license held.

(b) For stations participating in a message forwarding sytem, the control operator of the station originating a message is primarily accountable for any violation of the rules in this Part contained in the message.

(c) Except as noted in paragraph (d) of this section, for stations participating in a message forwarding system, the control operators of forwarding stations that retransmit inadvertently

communications that violate the rules in this Part are not accountable for the violative communications. They are, however, responsible for discontinuing such communications once they become aware of their presence.

(d) For stations participating in a mesage forwarding system, the control operator of the first forwarding station must:
(1) Authenticate the identity of the station from which it accepts communications on behalf of the system: or
(2) Accept accountablility for any violation of the rules in this Part contained in messages it retransmits to the system.

These rules will take effect June 1, 1994.

1331. Idea, 10-10 members....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-03 19:10:20 UTC
From: wb9omc@constellation.ecn.purdue.edu
Message-ID: <wb9omc.767992220@constellation.ecn.purdue.edu>
Source record: 49323
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radi.amateur.space

I'd like to gauge the interest among members of 10-10 International who
are on the Internet for a group, possibly called:

rec.radio.amateur.1010

The purpose of the group would be multiple:

1) to help disseminate information of general interest to 10-10 members
who have access to Internet.

2) to help 10-10 members set up skeds, nets and other communications events.

3) to help develop interest in not only 10-10 International but to maintain
interest in 10 meters in *spite* of the current lull in the band.

4) to help develop computer operating aids for 10-10 contests and
paperchasing.

5) to serve as one focal point for 10-10 members to discuss the organization,
contest rules, awards rules, etc.

6) other future purposes realted to Amateur Radio and 10-10.

****

I think that emailing me would probably be preferred to clogging up
a number of newsgroups with "me too!" kinds of mail.

If you are interested or have a *brief* thought on the subject, please
email:

wb9omc@harbor.ecn.purdue.edu

flames and/or mail bombs will be ignored, deleted, /dev/null'ed, etc. :-)

If interest seems positive enough, I will make some contacts with the
officers of 10-10 to find out in what ways, if at all, they would
like to make contact and maintain contact with such a newsgroup.

1332. still looking for project ideas

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-03 20:24:07 UTC
From: acc_mwb@exodus.valpo.edu
Message-ID: <1994May3.152407.1@exodus.valpo.edu>
Source record: 49325

I am currently finishing my junior year in electrical engineering. Next year, I will be working on a "senior project" with at least one other student. Taking a look ahead, we're trying to figure out some options for projects that we could do.

We'd like it to be in the are of electronics. Audio applications, signal processing, waveform modification, signal generation, filtering, etc. I don't know what else... so many different things, we hardly know where to start.

Other options that we'd like to consider are those in the communication electronics area. We'll be having communic. theory and electronics classes next year, so right now, we don't have much to go on in that area. I am an amateur radio operator. Something dealing with that would be really great!

Other areas of interest that might generate a good project would me some digital / electronics combination, applications dealing w/ transistors as switching (not in a power situation, but rather small things).

This project lasts two semesters. In the fall we finalize our project. Write up some designs, present the project, make a "project request" or something like that. Then, by Dec., have it ready to put together. Starting in Jan., we build a prototype, fix it, get it to work (ie. re-design and re-design and..). Finally, we'll end the semester by writing final reports, documentation and doing more presentations.

We'd like any ideas for projects that you think would be interesting, obtainable, and fit the idea of this "senior project."

___PLEASE____ if you've got any ideas, send some email to me. Just give us a couple of ideas that you might have. I'll post a summery to the list if I get some responses.

We were told in USAF MARS in 1981 to discontinue operating HF
mobile on MARS (i.e., Air Training Command) frequencies because
of some unidentified section in the final report of the ITU
WARC-79.

Hi All,

I am currently running KA9Q NOS version 930507 compiled for 386/486
copyright 1992. I think I pulled it of oak.oakland.edu .

When you telnet into the system you get the mailbox with various facilities
like telnet.

So when you use this telnet function to telnet to another host on the
internet network, it get as far as the intro messages before the login
prompt and just before you get the login prompt, the remote system
disconnects you.....help!

But if you telnet to a mail port (port 25) it connects fine and let you send
mail manually.

Please can anybody perhaps help?

Send all replies to jakes@maxwell.ctech.ac.za and I will then post it back
into this newsgroup.

Thanks

>it would bring the whole machine to a halt!

Not 100% true :-) For receiving packets the processor only reacts
to modem output transitions and it is done via an interrupt.
The key point is that the CPU has to measure the time when the interrupt
occured with a precision better than the time taken by a single bit
(3.3 ms for 300 bps, 0.833 ms for 1200 bps). A precision of about
0.1 ms is good enough for 1200 bps.
The trouble comes if the processor runs with interrupts disabled
for the time which is longer than the precision needed...
I can not say whether the LINUX system does so.

The approach I described above is applied in the BAYCOM program
and the AX.25 driver for the NOS written by me. The TFPCX driver
takes a different approach by speeding up the system timer
and sampling the modem's output at three times the bit rate
frequency.

Bottom line: if the LINUX operating system doesn't "blind" the CPU
to interrupts for longer than about 0.1 ms one could (in principle)
write a driver for the BAYCOM modem running at 1200 bps.

In a previous article, rogjd@netcom.com (Roger Buffington) says:

>Not hard to see why. GTOR, if it is all it is cracked up to be, should
>pretty much consign CLOVER to the ash can.
>--

I don't know that I would be that quick to discount Clover. GTOR is still an FSK mode running at 100, 200, or 300 bps. Packet has shown that 300 bps on HF can be tough, although it does not include the error correction capability of GTOR.

As explained at Dayton, GTOR sends the interleaved data frame with CRC first, then the parity frame if the data frame is corrupted. There are three ways to recover the original data: 1-decode the data frame, 2-decode the parity frame, or 3-combine data and parity to correct up to 3 bits out of every 24. In the best case, GTOR has a 230 bps basic data rate.

Clover, on the other hand, is a phase shift mode with longer signal element times. It will do better in fading or noisy conditions. But when the path is good (as 15 meters was a year ago) Clover will run flat out with a base rate of 750 bps or about 60 bytes per second.

There is no way to tell exactly how long the kernel will disable interupts
for, it depends on what is happening... and since ANYTHING could be, one
has to assume that there probabily will not be that kind of accuracy. Having
said that, however, there is a driver for Linux that does audio over the
pc speaker using a timer and some sort of PWM, and it works unless the
machine is busy with disk I/O or the like..... If you don't mind packet
loss when the machine is busy, and the machine comming to a halt when
packet is going on (as it does with the pc speaker), then perhaps I'm
wrong and it's worth a try.

One thing that I dorked around with was a phase shift detector using
a couple of op amps as zero-cross detectors and a micro-controller.
Phase shift meters are ridiculously expensive. I would think it would
be relatively simple to get one going with a micro and a couple of
op amps, capacitors and diodes etc. Might even be able to sell it.
You need to be able to meter current and voltage phases for a
commercially attractive project.

Thanks for the info Drew; was very interesting. The main thing that seems to characterize a comparison between the two modes is the apparent fact that G-TOR doesn't require a significant upgrading of hardware, whereas Clover by nature of being a four-tone AFSK mode, does. If GTOR is within shouting distance of Clover with respect to performance, , it may be that many amateurs will prefer to go that rout. Time will tell, of course.

Thanks again for the interesting info.

1348. TNC-RNET Interfacing

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-05 07:35:24 UTC
From: wordy@ucsd.edu
Message-ID: <wordy-040594233055@ece1mac26.ucsd.edu>
Source record: 49194

HI....

I am working on the Microship (the aquatic successor to BEHEMOTH,
the computer-laden recumbent bicycle, mobile hamshack, etc...) and
have been away from packet-hacking long enough that re-entry to the
field is quite dizzying. Amazing progress, and I feel like
a beginner again! <sigh>

The immediate project is to establish a business-band (itinerant
frequency) data link between my backpack and the ship, not only
for file transfers but also to allow a clone of the boat's GUI
software to run on the laptop, linked via RF to the on-board control
network of multitasking FORTH 68HC11s on a multidrop network.
I have chosen the Motorola RNET 9600-baud transceivers for this, and
have the units on hand.

The task now, which *should* be trivial, is to interface these with
the modem-disconnect ports on a couple of TNC's. To avoid
wheel-reinvention, I thought I'd first query this forum for comments or
experiences with this process. I have a couple of PacComm units
(Micropower-2 and Handi-Packet) and an MFJ-1278; I have not yet
chosen the TNCs that will be integrated into the ship. At the moment,
I'm working with a team of 18 UCSD engineering students, and we
want to get the system working at the breadboard level.

Thanks for any thoughts and suggestions! Email response is best;
I'll follow-up post anything that appears to be of general interest.

73!

1349. Standard C5718DA mod to allow 431.75 transmit, needed for 9600bps packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-05 07:36:50 UTC
From: kb7eec@uugate.wa7slg.ampr.ORG
Message-ID: <75543@uugate.wa7slg.ampr.org>
Source record: 49195

Hi. Does anyone have a Standard C5718DA (VHF/UHF mobile 9600bps packet ready) radio? I just hooked mine up to my TNC, and I found out that the radio won't transmit below 438.00 MHz. Does anyone know what I can do to allow transmit at 431.75 MHz? I would also just like to know if there are other people out there with this radio. I was considering the Yaesu FT-5100, but I like how the Standard C5718DA is 9600bps G3RUH packet ready without modifications. I now found out that Yaesu will modify the 5100 for 9600bps packet for its customers, but anyway the C5718DA seems like a great radio.

I also posted this query to tcp-group -- I probably should have posted it to this ham-digital group only. Well anyway, thanks for any info.

Gary

I have a KPC-4 for sale. Asking $200, its new in the box.

1351. [Q] your opinion for BEST HF PacTOR rig ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-05 14:26:24 UTC
From: khopper@kimbark.uchicago.edu
Message-ID: <1994May5.142624.19500@midway.uchicago.edu>
Source record: 49193
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

I saved a few $$. Currently using a Ten Tec Omni-V and looking
for an upgrade to a new rig. {I don't hear anything about a new
OMNI-7 ?? did anyone pick up on any rumors at Dayton ?}

What do you recommend for HF PacTOR ? something that will grow
with new PacTOR modes (PSK ?), run 300 baud G-TOR and have sufficient
audio bandpass,filters selection etc ?.

I see that only the Yaesu has a "RTTY" and "Packet" connector on
the back of the rig. But since most of PacTOR is/will be LSB and
not use the FSK capabilities of the rig - is there an advantage ?

Any suggestions welcomed.

TNX,

>packet is going on (as it does with the pc speaker), then perhaps I'm
>wrong and it's worth a try.

Just find someone having experience with the above driver and ask him
how it goes in real life. Then write a driver for the BAYCOM modem
and expect improvements:
1. On receiving the BAYCOM driver should be about 4-5 times more "reliable".
This is because the "speaker" driver probably takes the audio directly
into the COM port which I can estimate needs 4-5 times better timing
precision.
2. On transmiting the BAYCOM driver would not halt the machine. It would
just interrupt it 1200 times per second to make every outgoing bit.
By the way, the "speaker" driver is for 300 or 1200 bps packet ?

Anyway, the excercise of writing the BAYCOM driver would be an interesting
one. Even if you cannot make it to work on 1200 bps it may work on 300 bps.
If not, then go down to 100 bps. Slow link is better than no link :-)

1353. TM-733A & AEA DSP-2232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-05 16:58:16 UTC
From: phil@hansen.ncd.com
Message-ID: <2qb8j8$4d9$1@rosebud.ncd.com>
Source record: 49199

I just got a Kenwood TM-733A and have had a AEA DSP-2232 for some time. I connected them up last night and it seems to work!

Questions:
1) I measured the deviation (with a service monitor) and it is 1KHz max. What is the recommended deviation for 9600 baud packet?

2) If it is more than 1KHz, how can I increase the gain of the DSP-2232? I have already adjusted the one pot that is available.

3) How low of a TXDelay is possible with this combination?

Thanks!

Phil

:

A power supply in my Yaesu 980 was no where near what is required for
Pactor. To replace it, I ordered a Kenwood 450. Never having had a
Kenwood HF radio, I was still able to be up and talking on Pactor in
.. get this ... 15 minutes (but I already had a hot iron). It has so
many obvious features that lend itself to digital work that I went out
and replaced another Yaesu with a Kenwood 690.

Get the 500 hertz filter and ignore people who say not to use it with
GTOR. It works great.

I ran extensive tests (while away from home using the 690 to the 450)
with both FSK and AFSK. FSK showed NO indication of being superior.
I changed to AFSK so that I could parallel two KAMs and run Pactor and
GTOR on the same radio. By using AFSK, there are no frequency problems,
the frequency for Pactor is the same as the one for GTOR. You will find
that GTOR works great in a great band but you can't even connect in a
crummy situation. By having both the GTOR and Pactor you can take advantage
of the GTOR speed (especially above 40 meters) and still have Pactor for
crummy conditions and noisy 80 meter attempts (the 450 scans).

I just ftp'd JNOS 1.10C from ucsd.edu, but there are CRC errors in the Zip file, and the zip structure was destroyed (had to run a PKZIPFIX). I subsequently tried to search for the file with ARCHIE, but archie.sura.net (the server I generally use) is down, and none of the other servers can find jnos110c.

Does anyone here know of another FTP site where I can find JNOS 1.10C? The filename is jnos110c.zip if anyone else wants to give archie a try...

Thanks in advance

I have asked the same question except for my 3B2 UNIX box and EVERYONE says It can't be done or it could be done but would be slow and require precise timing and an integral knowledge of each function call in DOS and the equivelent call in UNIX. I've given up on the idea...But it's still one of those things that will always be on my wishlist (I have 8 serial ports imagine all the possibilities for this old 3B2).

I was wondering if I could run the Baycom TNC on my DOS machine
and my regular PK-88 thru my UNIX box and network the two
together some way using a slip connection???
Any ideas would be appreciated.

From: david@pitvax.xx.rmit.edu.au
Message-ID: <2qcpn7$kau@goanna.cs.rmit.oz.au>
Source record: 49270

Hi Packet fans!

I'm trying to assemble equipment to get started on this mode. I've come across an old modem that has a 'AM7910DC WORLD-CHIP' in it. I've heard that some TNC's use the 7910 chip, so am wondering if this is the same?

I will need circuit and pin strapping info for it as well - the original modem offered 1200/75 operation only. Looking in the packet directories of several ham archives (uscd, funet, buffalo) has yielded nothing on basic 1200b modems. I heard of a modem cct. in the 1992 ARRL handbook, does this use a 7910?

While I'm asking questions... can anyone tell me if 1200b packet (Bell 202) uses straight FSK and what the audio frequencies are? I can't find this info anywhere :-(

Thanks in advance

Well after many hours and late nights, I figured it out.....
It was my KA9Q-NOS station's escape character that caused all the disconnects from the telnet services. The default was control-X so I 've changed it to control-[. Anyway my system is now up and running.....

Thanks to everybody who has read this article.

: Pawel
Well, the speaker driver interrupts the cpu at >18kHz, so I guess that's
not a problem. The only thing is that during disk I/O and the like,
interrupts are off, causing noticable disruptions. Can you point me at some
relevant source code? I'll see if I can merge the two.

KaGold is commercial software, but there is a demo version
available on many ham BBS's. Sorry but I cant point you
to an FTP site. If you can't locate it, call Interflex
at (714)496-6639 or you can probably D/L it from their
phone BBS (714)497-5860.

I use PkGold (the AEA equipment version) and I think
it is superior to all other TNC software interface
programs, by far.

1366. Help for PK232 problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-06 19:02:10 UTC
From: as779@yfn.ysu.edu
Message-ID: <2qe47i$qi@news.ysu.edu>
Source record: 49210

Help!...Need assist with PK-232 problem.

Have suddenly partially lost ability to communicate with my
PK232. Using Mac LC, and both ZTerm and AEA MacRatt comm software,
the TNC refuses to recognize commands from keyboard. With MacRatt
trying to startup in "Host Packet VHF" mode,the message
"Host Mode cannot be turned on, check cable and baud rate" appears.
Resetting TNC settings from dialog box (Host Mode ON, CTS flow,
9600b Port speed) does not kick it back on.
In MacRatt "dumb terminal" mode, and also with ZTerm (another
terminal emulator), I can copy received packets, and with a CTL-C
get a returned "cmd:" prompt. However, no further input from
keyboard is recognized or acted upon, other than "cmd:" at CTL-C.

The cable is ok and have triesd a substitute.
The computer and comm port is ok, and I use terminal programs
with phone modem and same cables with no problems.
Supply voltage to PK232 is 12V or better.
The four LED's at leftlight at powerup, PKT mode LED lit, CMD LED lit.
Cold power up of PK232 yields the normal startup message on screen.

Is there another diagnostic for PK 232 or suggestions for
solution of this problem? Please reply to my email address.
(Packet reply just won't work for now :-))

Thanks in advance.

Well, I've used Yaesu-990 for PacTOR (and AMTOR and you name it),
and on PacTOR the rig hardly got warm... Full power, 110W. Maybe
it was 980-specific problem?

[Setting Yaesu for PacTOR took me less than 1 minute, BTW! :-]

In article <2qduql$aib@jericho.mc.com> Bob Levine, levine@mc.com writes:

>KaGold is commercial software, but there is a demo version
>available on many ham BBS's. Sorry but I cant point you

I have the KaGOLD version 9.01 and I think it is the best thing going for vanilla AX.25 packet. One word of caution (OK several): That KaGOLD test drive SUCKS!!! I think that it is probably keeping them from getting rich off the real software. It works, but after you have decided that you like it and need to go back to your old software while you wait for KaGOLD to arrive, you will find that "TESTDRIVE" as it is called does not revert your TNC's settings to their former useful state. This causes no end of frustration.

KaGOLD TESTDRIVE is also representative of the software from about two generations ago, and many of the new features that make it so nice are not present.

Buy it direct from Interflex, the vendor. It costs the same, and I know too many people whose disks from HRO have been unusable. Also, you get the very latest version and they usually throw in a disk of goodies. KaGOLD is key-locked to prevent unauthorized use. When you get it, even if from HRO, you have to call the company anyway. They give you an 11-digit "registration number" which, when combined with your callsign, unlocks the software. If you call them to order it, they will ship it 2-day Express Mail and will give you your registration number so that if you have a modem you can call up their BBS and download the software for immediate use.

Hi,
I have been told that the CAP number of a pager is different to the actual
number broadcast by the pager company. Is there any way to convert the number
that is transmitted to the CAP code?
Please E-mail if you can help. Thanks in advance.

Grab the file hispeed.005 from pub/hamradio/packet on hydra.carleton.ca.
It's a list of equipment options rather than a 'howto', but it will give
you some of the info you're looking for. I've got some post-Dayton updates
to do, so there should be a hispeed.006 along soon...

SB NETSIG @ TAPR $TAPR507.001
NEWS: TAPR NET SIG @ Dayton

Tucson Amateur Packet Radio May 7th, 1994

TAPR Regional Network Speical Interest Group -- Dayton Report
---

Nearly 40 hams attended the NETSIG meeting held on Saturday, April 30, in beautiful, warm, and sunny Dayton, Ohio.

After an initial -- and very interesting -- trip around the room to let everyone describe their network status and problems, the discussion moved away from the four specific NETSIG goals and into a more general discussion of packet networking. Some of the provocative ideas put forward were:

1) Can we <really> build a nationwide RF network in the forseeable future? The concensus was that we probably can't, at least until we have geostationary satellites.

2) As network builders, what are our goals? Vic, K1LT, raised this issue and hopefully he'll be expanding on it in another message. The point is that the network we build has to be based on what we want to do, and that's never been well articulated.

3) How do we get user involvement? First the BBS, and now PacketCluster, could be considered "heavy apps" for packet. But is there another big app lurking that will make packet networking <really> take off? It's clear from the discussion that services like "convers" will lure users into exploring --- and loading -- the network. Several folks thought that the internet gateways may be it. Jay, WB8TKL, called for a challenge to provide gateway access on every local network.

4) Following on from that point, the group agreed that training -- both on using the network, and using the apps -- is critical.

5) And, many felt that the gateways would play a critical role in linking our networks.

Lots of other issues came up, but these were the major ones (at least, they were the ones that showed up in the notes!).

Let's keep this discussion going, via the netsig mailing list. What do <you> think about these issues? To Join, send Internet e-mail to 'listserv@tapr.org' and put in the message body 'join netsig'.

****

The next meeting of NETSIG will be at the ARRL CNC in Minnesota in August.

SB BBSSIG @ TAPR $TAPR507.002
NEWS: TAPR BBS SIG @ Dayton

Tucson Amateur Packet Radio May 7th, 1994

TAPR BBS Special Interest Group -- Dayton Report

Over 40 people participated in the Dayton meeting of the TAPR BBS Special Interest Group. Those who attended ranged in experience from the just plain curious to the very dedicated. People started gathering prior to the 6:30 PM published meeting time and were eager to begin discussion. One of the co-developers of the hierarchical address method used by packet BBS software, Dave Toth, participated. A member of the ARRL Digital Committee, Bo McLean, also attended. Their input to was greatly appreciated by all.

One of the purposes of the meeting was to provide an opportunity for a free discussion of ideas. While a bit chaotic, this unstructured exchange was useful. It permited sysops to hear, first-hand, what issues were important to sysops in other regions of the country. At Dayton, we were fortunate to have input from amateurs in Canada and Great Britain, as well as from most parts of the US.

Before discussion got too far along, an exercise was conducted in which the active BBS sysops were asked to list the five most important concerns they had as sysops. This helped to define some issues which needed to be discussed in more detail in order for those participating to feel their time at the meeting was well spent.

Message content was the most frequently mentioned concern to sysops. Fear over losing one's license for being tied to a message whose content violated Part 97 was the number one issue with those attending. Also mentioned very frequently were accountablility (a close cousin to fear of losing one's license), the desire for the indentification of a series of standard '@' fields, and the growing amount of what was termed 'junk mail' which might be displacing P-type messages on the

busier parts of the forwarding network.

Overall, the top-five list exercise and the open discussion indicated that the issues on the mind of most sysops are content-related. Only later in the meeting, with a little steering in that direction, did the focus turn to how TAPR and the BBS SIG might first concentrate on making the mechanics of BBS operation more efficient. While the BBS SIG can't directly impact message content, it is important that participating sysops be given plenty of time to share what they're thinking about. Only at a national gathering such as this would sysops have a chance to find out what sysops across the country are thinking about.

Sysops from all over generally agreed that what started out as a means to send personal messages to individuals has increasingly become a forum for the promotion of ideas and 'for sale' messages. Many stated that they were somewhat disillusioned over this metamorphosis. It was further agreed that there probably isn't enough awareness among users that the systems to forward messages have physical limits. It will be worth a try for the sysops to better educate users on this, starting on a one-to-one basis. Sysops of urban boards were especially concerned that the networks for forwarding were going to grind to a halt. No one wanted to inhibit the growth of packet radio, overly restrict users, turn being a sysop into a full-time profession, or go broke, keeping up with increasing traffic amounts.

Eventually, discussion turned to how the TAPR BBS SIG could begin to help improve the efficiency of BBS operation. Several of the points made during the Packet Forum presentation on the

BBS SIG were among those mentioned during our meeting:

@ operational issues (rather than content) are good starting points;

@ all of the problems associated with message forwarding can't be solved at once;

@ a library of hints and kinks collected and maintained by TAPR would be very helpful. This library could be available as an on-line service and published as a pamphlet or book;

@ BBS software writers should be made to feel comfortable to participate in the SIG. It could be a good opportunity for constructive exchange. We depend upon each other (sysops and software writers) to keep doing what we are doing in our hobby. We won't learn anything new and continue to have fun if we don't communicate with each other;

@ an (inter)national organization, such as TAPR, is well-suited to transcend regional tendencies to reject ideas not invented

locally;

Several resolutions were made. One was that the group that met was to reaffirm the use of the two-letter continental designators until the matter could be studied in depth. The group also resolved that TAPR study and issue a list of most-frequently-used 'TO' and '@' fields. Yet another resolution by the group was for TAPR to recommend a common flood bulletin structure.

A meeting by a smaller group of sysops on took place on Saturday evening while the NET SIG meeting was held. This smaller group reviewed the discussions of the previous evening. It was agreed that a Request for Comment be prepared and issued. Incorporated into this RFC would be solicitation of input for a proposed set of setup tips for the most popular BBS software in use today. More information on this will be published on the BBSSIG Internet forum as it is prepared. It is expected that the collection of setup tips will be completed in time for the ARRL Digital Conference being held in Minneapolis in August.

The next in-person meeting of the TAPR BBS SIG will be held at the Digital Conference. As always, you are encouraged to use the Internet forum established by TAPR to exchange ideas and request help from other sysops.

To Join the TAPR BBS SIG, send Internet e-mail to 'listserv@tapr.org' and put in the message body 'join bbssig'.

SB TAPR @ TAPR $TAPR507.003
NEWS: TAPR Dayton Report

Tucson Amateur Packet Radio May 7th, 1994

TAPR at Dayton

Dayton, 1994

Dayton this year for TAPR was great. Mel Whitten, K0PFX, Dave Wolf, WO5H, Dorothy Jones, KA5DWR, John Bennett, N4XI, John Ackerman, AG9V, Fred Treasure, KE5CI, Bob Stricklin, N5BRG, Shelton McAnelly, KD5SL, and Adam Tate, AB5PO, made working the booth a lot of fun. If I missed anyone,

thanks for helping. We were short-handed a number of times, but were able to keep the booth manned with Dorothy and two others most of the time. Attendance at Dayton seemed to be about the same but the weather was awful! It rained the entire weekend and then got cold and rainy on Sunday (snow flurries were predicted!). This was good and bad. It kept the flea market folks inside looking at the exhibit stuff, but then made the in-door convention areas so crowded that it would take literally forever to move from booth to booth.

The Friday Packet Forum, moderated by Bob Neben, K9BL, saw a number of TAPR members making presentations. I presented the opening talk on Packet Radio for the Beginner, which saw a turnout with about 50% or a little less novice or potential new users. The TAPR/AMSAT DSP-93 Project was presented by Bob Stricklin, N5BRG. Dave Wolf, WO5H, discussed current happenings in the TAPR BBS SIG. Mel Whitten, K0PFX, made a presentation on Interfacing WX Data to Packet, followed by John Bennett, N4XI, speaking on WX Station Interfaces. John Ackerman, AG9V, made a presentation on the TAPR Regional Network SIG and its current direction and efforts. Dewayne Hendricks, WA8DZP, discussed current FCC Regulatory Issues and the impact they might have on digital communications in the future. I hope I didn't miss anyone, but the forum as usual was well attended for the whole time. Another good job this year, Bob.

The Friday and Saturday night SIG meetings were a success although the room we had at the Radisson was almost as bad as the weather. The room was hot and stuffy both nights. Friday night the air conditioner was broken and on Saturday night they had it fixed, but turned on the heat since it was supposed to be down to 34 degrees that night -- couldn't win. We made do, but we definitely will want to fix this for next year. I will be working with John Ackerman, Bob Neben, and Robert (of the national packet round table) next year to think about ways we can organize the Friday and Saturday night activities. We have access to space at the Roadway Inn or we might be looking for some place else. Have a few months to get everything lined up. The Saturday evening meal at McNasty's was well attended, but a number of folks believe that a change here is due. If you have an opinion one way or the other please let us know at the office. I think we will look at having a packet forum Friday night along with the BBS SIG. More packet talks or something. Then on Saturday we will look at a possible change in dinner locations which will allow us to hold the NET SIG and different general discussion groups. I would like to still have a place at the Radisson since it is easy for the group to get to and it also allows a common place for people to stay up past midnight to chat. So, will have to think carefully about this. The NET SIG meeting on Saturday had folks up past midnight talking technical issues.

I think we can consider Dayton another success this year. If you didn't make it this year, you should plan to come next year. Dayton is a lot of fun and TAPR plans to do more packet activities next year. Till then!

If you wish to join the tapr-bb mail list, send Internet e-mail to 'listserv@tapr.org' and place in the message body 'join tapr-bb'. TAPR

sends out various bulletins via this mail group.

Hello all.
I am trying to get TPK working with my local F6FBB pbbs, but I'm having a few problems. The most difficult problem is getting TPK to log the unproto message headers that are transmitted by the bbs to be logged to my hard drive. I am using MS-DOS v6.2. I have set a path to tpk in autoexec.bat as well as an environment variable. I'm also running Doublespace. Does anyone have any suggestions? I'd like to get this thing working properly.

Thanks,
Don, N3KFH

That is not the way I interpret the POCSAG standard. The code transmitted by a pager company is the CAP code for the appropriate pager. To do it any other way would be a bit assinine because that would force the software developers that work on pagers to include bulky decoding algorithms.

The full address of a pager is 24 (or is it 18) bits (if my memory is correct). The address being broadcast is only part of the complete address with the remainder of the address being which frame the message starts in. I do not remember if the first part of the address determines the frame or the last part - I think it is the first 3 bits.

Anyways, my memory is a bit faulty...

BTW... Why did you use an anonymous address to ask this question? It's not as if POCSAG is classified information... ANY good technical library will have reams on the subject.

Cheers.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Editor, HICNet Medical Newsletter
Internet: david@stat.com FAX: +1 (602) 451-1165
Bitnet : ATW1H@ASUACAD

Don, I run TPK here in Mobile, AL with our club BBS, W4IAX... It has been my experience that the weak link has always been in the analog part of the system... Do you get good connects and fast response from the BBS...??? i.e. not many retries on connecting and reading messages manually... If you are getting anything at all logged to the hard drive then your problem is in the TNC/RADIO/ANTENNA link... Without knowing any other particulars, I couldn't tell you much more... I have friends who are running TPK with DOS 6.2 with no trouble... (I am using 5.0 still -- solid) Hope this helps...

From: forrerj@frl.orst.edu
Message-ID: <forrerj.30.0@frl.orst.edu>
Source record: 49226

Hello fellow DSP experimentors,

After quite an effort, I now have a beta version ready for testing
my HF DSP modem software for a PC sound card. The sound card's DSP
runs the real-time modem code, while the host PC does bit-assembly
and the user interface. Presently only AMTOR is supported, but new
modes will be released in future.

Please note that this software will only work on PSA-based PC sound
cards, i.e. those using the Analog Devices PSA chipset that includes
an ADI 2115 DSP chip, i.e. Cardinal, Orchid... This is a minimal budget
alternative for a very useful DSP platform for PC's.

This is free software, available via anonymous ftp from:

UCSD.EDU /hamradio/packet/tcpip/incoming/psator.zip + psator.txt

Enjoy,

Johan Forrer

Just to back up Drew's comment: on my path with W5XO (Porltand, OR to
central Texas - an excellent one hop path) we often observed the link
on 15M running at full 750 baud data rate for many hours at a time.
This is with low power (50W) and avarage antennas (tribander/dipole).

Lines: 17

Hello all,

I have just aquired a G3RUH 9600 modem for my TNC. I am wondering if
anybody has interfaced this unti with a Motorola Mitrek 440 radio. This is
a crystal radio and was wondering if anybody has had success or failures with
this model, or if major mods are required.

This is my first attempt at 9600 and am hoping to show that there is
still life in packet, once you get past congested 1200 baud channels!

Thanks!

1387. Software for KAM Plus?

Newsgroup: rec.radio.amateur.digital.misc

I am looking for recommendations for software for the KAM Plus. My primary interest is HF communications modes, PACTOR/RTTY/AMTOR/GTOR.

I understand Kantronics makes something called Hostmaster II, plus I've heard mention of a package called KAMGold.

Feedback would be appreciated?

--

I was working for a company that did some testing of that radio on packet at both 1200 and 9600 bauds. The 1200 baud operation is great, the 9600 baud operation is not as good as some other radios.

Most notibly, radios that modulate the PLL directly don't work as well as radios where a crystal oscillator is modulated. The problem is that the PLL tries to correct for the frequency error introduced by the applied modulation. The IC-281 is a radio who's PLL is modulated. The Alinco DR-1200TH and DR-1200TH2 also fall into this catagory. If you're looking for 9600 and top-notch performance, the IC-281 is close, but not optimum.

I've had my DSK for a week and the appearance of this code (I found it on ucsd before your post) got me excited enough to finally hooked it up at least for RX. It lite right off as far as DSKJNX talking to the 320C26 but I've yet to actually receive anything. Of course I've just had it hooked up for 1/2hr and dinner got in the way. The docs are a bit sparse so have been exploring the keyboard. Show's looks like it'll be real neat when I have it fully working!

Well after a little tinkering... I've got it receiving (haven't hooked
up TX yet). Did OK with all modes, RTTY/Amtor/Packet.

The thing I did have to do is to go into the ALLMODE.INI file
and change AICAuxIn line to F

This thing is quite a bargain... I got mine from Arrow Electronics

: Any suggestions welcomed.

I use the Kenwood TS850/SAT and have found it to be wonderful for Pactor and Amtor. The dual 500 Hz filter option really lets you lock in the signals for good solid QSOs. The rig was designed with these modes clearly in mind, with neat options such as selectable FSK shift (200 Hz for Gtor and Pactor, or 170 for Amtor/RTTY/Packet and others for other modes not invented yet!), slow decay on the S-meter so you can give signal reports even on Amtor, and lots more.

The rig just loafs along in all these modes, cooling and power-supply wise.

My vote is for the 850 :-)

Sounds like you have the "X-on/X-off" terminal data flow setting on. Try
turning it off and also set your computer for hardware flow control (aka
"RTS/CTS"). If all else fails, clear the memory in the PK232 by removing
power from the unit, then remove the battery jumper. Wait at least 60
seconds before you replace the jumper. If that does not cure the problem
and you are SURE that your cable is good, call AEA.

HI Everyone:

I have a kantronics KPC-3 TNC and 486 IBM computer and a 2 meter radio.
In our area we dont have full service BBS. I was thinking of setting up
a full service BBS so that people can read messages relatively easily.
I would like to get it started soon. I have access to internet ftp sites,
will anyone familiar with BBS point me out to how to setup BBS and which
software will be of happy with the above mentioned hardwares.

I would appreciate any help in setting up full service BBS.

Thanks a lot.

I run RTTY, AMTOR, and PACtor on my Yaesu 990, and have never had any
problems with the power supply or overheating. We've run 48 hour RTTY
contests (the fan runs plenty often during them) and held very long
ragchews on RTTY, which is 100% duty cycle.

On Amtor I've gone an hour or more in a qso, and similar on PACTOR. It
should not matter to the radio whether the PACTOR or AMTOR user is
a keyboarder or a BBS, I would not think. Since the protocol (AMTOR at
least, I haven't looked at PACTOR) is syncronous, it is necessary to
send characters even when the user is not typing. Perhaps you were
referring to the fact that the station pulling 30 or 40 messages from a
BBS would not reverse the connection and thus one end would have to
be sending longer packets than the ack/nak from the receiving end. Even
so, it just depends on the rig's ability. If the rig is rated at 100%
duty cycle, then it should handle it. The 990 is so rated.

One curious question: If one station is sending 30 or 40 messages before
turning the line around, when does the receving station get to ID? It
seems to me that more than 10 minutes may have passed...

1402. Permanent NOS Server

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-10 19:51:51 UTC
From: jcaradim@gr.oracle.COM
Message-ID: <9405101951.AA15889@GRSEQ1.gr.oracle.com>
Source record: 49255

Hi everybody,

I am an avid user of NOS in the local TCP/IP .ampr.org network, but I face a tiny problem, so I decided to solicite some help from more experienced readers of this list. Here we go :

I have a 80386/33MHz PC running NOS and a PK-232 connected to an Icom IC-229 transceiver. Now, this setup works OK, exept that the poor PC (hihi) has developped a kind of fondness for the network and is always connected to it. As a result, I do not have a PC for my other occupations (unfortunately I am in computer business, so a PC has to be used in other cores also, except our hobby).

I thought of using a dedicated PC for that, and I am currently looking for one (OF COURSE for free, you don't pay for a PC in this business). However, I can not ask my supplier (or should I say "my beneficiary") for an expensive, top of the line machine. An 80386SX or DX with 1 MB of RAM and maybe a 40 MB disk, is all I can look forward to. Perhaps, this will be enough for plain vanilla operation, but I have also heard that you can use this PC as a server, and connect my normal PC to it, as a client via a null-modem cable and SLIP connection. That sounds like a very promising idea (remember : ignorance is the source of happiness), however I am a bit confused over the whole setup.

Could some helpful soul give me some hints? Like for example :

1. Besides the fact that by following this setup, I can live with a lesser machine, what other benefits will I have?

2. I presume that the two PCs will form a small network. Do I need an IP address (from my coordinator) for the client as well as the one for the server (I suppose that the IP address of my current PC will be given to the server PC), or is the client IP address used only internally, therefore I should not bother my IP coordinator?

3. What sort of client software can I use? I've heard that there are some Windows-based client programs. Any hints please? Comments?

4. I initially thought of using network cards between the two PCs, but the cost is high. Given that the radio is the bottleneck, how faster would it be, if cards are used instead of SLIP connection?

5. Have I understand it correctly, that I could then add a modem to that SLIP-using serial port and have access to my mail, when I am away from home thru a notebook (using the same client software)?

Needless to say, that any advice will be greatly appreciated.

By the way, if my questions seem silly for the list, I wouldn't mind personal answers at the addresses below (nor will I be offended).

Ken:

I have an Icom 735. It's a great rig for AMTOR/packet. I have used it for
these modes for 5 years and it works fine. A friend also uses AMTOR alot nad
he has a Kenwood TS440S. This is also a fine radio for these modes. All you
need to make sure of is the radio tx/rx turn-around time is FAST...typically
under 10mS. This will ensure that your AMTOR contacts will be reliable.
Stay away from any radios that do not have solid-state switching.

Yes the ROM can be upgraded, in several different ways. You can use
a new MFJ ROM, or the New TAPR TNC2 ROM, but you may also need to
upgrade the RAM to 32 Kb in order to use them. Or, you can use the
K3MC KISS_ONLY ROM. This code will work in any TNC2 clone and forces
the machine to always be in KISS mode. This is the preferred solution
for dedicated sites since there's no chance of the TNC dropping out
of KISS mode because of a power bump or other occurance. A hex image
file is available on ucsd.edu and TAPR can also supply the ROM.

1408. UPDATING 1270 ROMS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-11 06:24:28 UTC
From: n6ng@crl.com
Message-ID: <2qptms$rkb@crl2.crl.com>
Source record: 49248

I know of no combination of keys to accomplish KISS mode if it is not included in the ROM version in the 1270. However, I'm fairly sure you can still get a new ROM with the KISS command from MFJ.. I did about a year ago for the same reason. Give them a call and I think they can solve your problem..

From: weldp@tiac.net
Message-ID: <2qpkcc$1mp@sundog.tiac.net>
Source record: 49243

I bought an older MFJ-1270 (Release 1.1.2 12/30/85) at a flea market thinking I could use it with NOS. After reading the manual it seems like there is no command to put it in KISS mode. Is there a combination of commands I can use to put the TNC in KISS mode.

If this is not possible I wonder if the ROM can be upgraded?

For DOS stuff, I would take a look at oak.oakland.edu, /pub/msdos. This
is one of the primary Simtel mirror sites, and has a lot of DOS stuff.

For Windows, try ftp.cica.indiana.edu. I don't know the directory
structure on this one, however.

Hope it helps...

Sean -
We have a network on 430.xxx Mhz about 70 miles from you, called Metro-NET that
connects a number of VHF 1200 Baud user ports in strategic geographic areas
around the Minneapolis/St. Paul area. We have 7 in the network and all work
fine all at 9600 baud and mostly at 430.xxx. There were at least two
frequency bands Motorola manufactured for: 408-420 and 450-470 Mhz. The
408-420 Mhz units move fine to 430.xxx or 449.xxx but I have heard that
the 450-470 Mhz unit have a hard time moving to 430 ..... 449 is probably
ok. Some local folks have stayed on the Kantronics-provided frequency,
430.550 MHZ, which is reserved in Minnesota for general usedr use.
Modification is very straight forward and is described in several past issues
of TAPRs PSR. We bought all MITREK from C.W. Wolff in Montana and use them
with PacComm TINY-2 MKII TNC with their NB-96 internat G3RUH-styl modem.

I run (not simultaneously, of course :-) both a PK-900 and a KAM Plus
into the FSK connector of a Yaesu FT-990 both for PACTOR and straight
RTTY. No problem whatsoever.

The advantages of going this route, instead of injecting tones through
LSB are 1) the filters in the rig are properly centered, without
fiddling with passband tuning, to where the PACTOR controller wants
to see the signal, and 2) you won't accidentally have the speech
processor turned on and splatter whatever tiny RTTY subband we have.

Nothing wrong with your Omni V at all for PACTOR work. I also own
an Omni-V. Notice that the Omni performs FSK by frequency shifting
an RF oscillator, whereas a rig such as the FT-990 injects the output
from an internal AFSK oscillator into the LSB modulator. The religious
can dance on the head of a pin as to which scheme is superior :-).

Hi Everybody,

The East Atlanta LAN Group is putting up a 9600 bps packet user node for our LAN. I purchased a GE Master II transciever at Dayton for use as the RF side of our simplex digipeater on 441.0 MHZ. We plan to move to duplex operation as soon as we figure out how to set it all up.

Question: Does anyone have any experience using this transciever in this application? Got any experience you can share to make the task easier?

Tks much,
Steve Diggs KB4ZTN

1418. DSP4 Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-11 23:08:39 UTC
From: jpll@vectorbd.com
Message-ID: <CpnuyG.EM@vectorbd.com>
Source record: 49263

Dear friend,

Here is some information about the DSP Card4 project and how to get a board.

Background:

The DSP card project has been developed by Jarkko Vuori (oh2lns) and
Kaj Wiik (oh6eh) as a part of their studies and radio amateur / satellite
/dsp hobbies. There has been also dsp card1...3 before this. The history
is included in the documentation.

During Autumn -93 a batch of 100 boards was made (mainly to
hamradio community worldwide). The 'mass production' was arranged under
the name of local hamradio club RATS r.y. (OH2NXX).

Availability of the DSP Card 4

The circuit board is available via RATS r.y. At this moment there are some
rev 2.3 boards left. New boards will be made during summer -94.

RATS has ordered also a box of the dsp56001's, the confirmed delivery is in
August.

A group order of components was arranged by oh2nxx too.
There was following kits:

PCB: (240 FIM or 40 USD)
Kit1: DSP56001,CS4215, 27MHz XTAL, 24.576 MHz XTAL (800 FIM)
Kit2: All integrated circuits (14 pcs) + XTALs (1100 FIM)
Kit3: All parts to be mounted on the PCB (1700 FIM)

If there is enough interest, new order of components will be made also
later this year.

If you want to buy a board it may be worth of trying to send the money
in a letter, as otherwise you must add 40 FIM for us to purchase a cheque
or similar.

Where to find the latest stuff?

All the new software and the latest documentation is available via Internet
from ftp.funet.fi, directory /pub/ham/dsp/alefn/dsp4. They are also
available from jeeves.hut.fi, directory /alefnull.

There is also ongoing mailing list available where the myriads of DSP CARD 4
technology is discussed:

DSP4 related list: dsp4@lists.funet.fi
Subscribe/unsubscribe with:
To: mailserver@lists.funet.fi
Subject: (whatever, you will see it in server's reply)

SUBScribe DSP4 Your Personal Name
UNSUBscribe DSP4

("SUBS" is shortest form of the command, longer version can be
used too..Commands, and list names are case insensitive. More
info with `HELP' command)

Submission to the list shall be addressed to:
dsp4@lists.funet.fi

If you don't have possibilities mentioned above, limited support can be
obtained by sending a SASE (and diskettes, if needed) to
RATS r.y. PoBox 88, FIN-02151 ESPOO.

: Chris Wysopal, n1obj

--

Nope, you're going to need newer firmware, and depending on the firmware you get, you may also have to upgrade the ram from 16k to 32k. A popular free replacement firmware with good solid KISS performance is a package called TheFirmware. It is an enhanced version of the WA8DED firmware, and I don't think it requires the upgraded ram. I'm not sure when the first versions of KISS were done, but it was probably about that time, and they had to be uploaded to the TNC each time it was powered up. That's a very early model of that TNC, and KISS wasn't stable enough in design or coding to have been committed to EPROM. You can also upgrade to newer versions of the traditional TNC-2 firmware - the MFJ was a licensed clone of the TAPR TNC-2, and at least up to a year ago or so new features were being added to it. They will require the ram upgrade tho.

Hope that helps! 73

I got mine at the ARRL Computer Networking Conference in San Jose, CA, but others in this area are interested in them too. My best guess is to contact Henk Peek, PA0HZP at his callbook address. The schematics, parts list, and parts layout were posted on 'ucsd.edu' at one time. A board mask was not among the included items. I hope someone comes up with firm information on price/availability/ordering instructions for the board.

I have a friend who run's KaGold with a KAM+ and Likes it very much.
It supports PACTOR/RTTY/AMOTOR/ (GTOR I think) and PACKET !
I have used a version of it called TESTDRIVE for VHF PACKET and like it
But the TNC I use HAs some Limititions using Kagold.(KPC3).
I think that you KaGold is a good Choice.

>
Basic principle for all xtal rigs is as follows:

For the RX: find the discriminator output (before any audio filters) and take a feed from there

For the TX: put a varactor across the xtal with a bias circuit and inject the signal from the modem into it. I knocked up a simple circuit with a dual op-amp and a voltage reference to level-shift the signal to what I needed for the varactor.

Some TX may actually have the varactor in place, but most seem to use a phase modulator after the xtal oscillator so you will have to fit one. You will need to determine the varactor capacitance swing needed for your particular rig. Basically, you need to be able to pull the xtal far enough either side of centre to give a signal approx 20kHz wide at your transmit frequency.

1430. Micor 9600 Bd Mod Revised

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-13 06:33:45 UTC
From: daniel.meredith@aznetig.stat.com
Message-ID: <94051223361135@aznetig.stat.com>
Source record: 49272

This is the REVISED Modification for the MICOR UHF MOBILE for 9600 Baud Operation:

This is an updated text file containing the MICOR 9600 Baud operation modification. The only major changes are the X-TAL filter changes and t wiring of the first stage of the exciter board "hot." The changes are noted with a > in front of the text.

First, the MICOR was modified for "stand alone" operation (without a control head) - on P901 (the big connector in the front), pin 11 is jumpered to pin 1 (Gnd), pins 8,3 & 22 are connected together and to a 2amp fuse connected to the big A+ feedthru going into the PA. All these jumpers are done on the control(interconnect) board, except for mounting the fuse itself. Unless you want speaker audio to listen to, there is no need to install volume or squelch pots, and the audio amps are not used in this application.

Second, we did a couple mods that seem to help prevent problems before they arise: add a capacitor (at least 20 microfarads, I use 220 uf) across C903 on the control board (this is the tubular electrolytic located just to the rear of the 9.6v regulator transistor heatsink). Add a diode (1N4001 or better) from P901 pin 16 to any of the A+ pins (3,8,18), with the banded end to the A+ pin. (this is a "spike" suppression diode)

Third, one mod on the Audio/Squelch board: replace C203 with a 1-10uf electrolytic/tantalum- I recommend at least a 20v rating. This improves the low frequency end of discriminator audio.

If your radio has a CTCSS encode board plugged into the exciter, remove it. Install JU304, which is located immediatly adjacent to the encoder board connection on the exciter. Depending on which exciter you have, the encoder will have either 7 or 11 pins - in either case the pin you will use to inject transmit "audio" is the one adjacent to the big square hole, towards the outside edge of the radio (pin 6 for 7-pin, or pin 10 for 11-pin ones). Connect a shielded lead from this pin to an unused pin on P901 (I use pin 27). On the exciter, trace the land from the pin you just connected to and you will find an 82k resistor - replace it with a 10k resistor (1/4w) and a 10uf capacitor in series. (Some exciters already have a 6.8uf cap in series - if you are SURE yours has the cap, you don't need to add another!

> On the receiver RF/IF board, remove the SENCOND (2nd) and FOURTH (4t

> is just right and I have continued to maintain a retry rate of 0-1% fo
> past 2 years now on all links that contain MICOR/MITREK mixes.

Thats ALL there is to it - naturally, you need to tune the radio up, but I figure you already knew that! Connect your transmit audio to whichever pin you connected the jumper to, receive audio (discriminator) is on pin 20, PTT is pin 16, and 12v goes to the two big pins in the middle (pins A and B).

I would advise obtaining a service manual for these radios if you plan on using them - it is Motorola part # 68P81015E70, and you should be able to order one through any Motorola service shop.

The original mod was written by Hartley J. Gardner, W1OQ@N7MRP.AZ.USA.NA and implemented by Daniel J. Meredith, N7MRP@N7MRP.AZ.USA.NA

The revision to this mod has been worked on by both of the above mention parties and has been revised by Daniel J. Meredith, N7MRP@N7MRP.AZ.USA.NA

From: jpll@vectorbd.com
Message-ID: <Cpr17w.BBn@vectorbd.com>
Source record: 49281

Texas Inst. is now accpeting orders for the C50 version of the DSK.
It "hit the street" on 5/1. The price is $99.95, the same as the C26
version.

The code from a C26 will probably not run on a C50 version. The port
should be easy, so we can hope HB9JNX and KC7WW will have access to
a C50 and will provide us with new versions.

1435. Help: Routing with X1J

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-13 16:43:27 UTC
From: hardie@herald.usask.ca
Message-ID: <2r0anf$okh@tribune.usask.ca>
Source record: 49277

The problem is quite simple. We can't get our local X1J node to respond to
a 'ping'. If I ping the next node down the line then the local node takes it
and sends it on, the remote one generates an echo reply back to the local node
which then does nothing.
So the routing is mixed up somehow.
The local node address is 44.135.128.6 and there's a route entry for
44.135.128.0/24 Port 0 (AX.25)
Any 44.135.128.0/24 address is one that is local to the node (e.g. mine is
44.135.128.1). If the local node sees an ARP request for its address then it does
respond to that. But anything else that it ought to send gets lost somewhere.

What routing/arp entries are required to make the node spit out packets that
are for local users?

According to the TEKK people in Kansas City all KS-960 LOW-BAND radios shipped for the last 6 weeks have had a mod that allows 9600-baud operation. They will make the mod at no charge if the unit is within warranty. Also, a mod article on the TEKK radios has or will be published real soon by NEDA. I found a file on the WA6RDH landline BBS. The word is that the mods improve throughput by 40%.

1440. PK-232MBX vs. MFJ-1278B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-14 05:23:21 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May13222321@hobbes.vigra.com>
Source record: 49285
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I went shopping for my first multimode TNC today, and pretty much narrowed it down to the MFJ-1278B and the AEA PK-232MBX. I'd love to hear from you net.hams about which you prefer and why. Here's my comparison based on what I know so far, which is pretty much from adverts and data sheets. If you have any pointers to reviews that might help, I'd like to look them up.

I've read the packet FAQ and some other literature, and decided that I will probably be using the TNC for more receiving than transmitting. I'd probably have it hooked up to a Unix workstation most of the time, maybe a DOS machine on occasion. I'd like to experiment with TCP/IP under FreeBSD as well. I'm also interested in receiving all the mystery digital broadcast tidbits on shortwave, especially wefax and other images.

The PK-232MBX claims the following:
$299 at HRO ($399 list)
Rx & Tx: Packet, Baudot and ASCII RTTY, ATOR / SITOR ARQ and FEC,
Morse code, WEFAX, PACTOR, and Gateway.
Rx: NAVTEX/AMTEX and TDM
18K (non-expandable??)
PakMail
17-pole "effective filtering"
SIAM ("for auto RTTY signal ID")
Host Mode

The MFJ-1278B looks like this:
~$299 at HRO ($299 list)
Modes: Color SSTV, Color Fax, "16 Gray Levels Modem", Packet, AMTOR, RTTY,
ASCII, CW, Fax, SST, Navtex
32K RAM (expandable to 128k, 512k)
Contest Memory Keyer
Free AC power supply
"random code generator" (?)

Both have KISS mode, which is important to me, since I like to hack protocols and TCP/IP stuff. I avoided 9600 baud TNCs, since they tended to have less modes, and I don't have a 9600-capable radio. Here are some questions I'm hoping to answer:

What is special about "PakMail(tm)"?
Is the PK-232 fax grayscale or 1-bit B&W?
Is the MFJ fax really full-color, or is it "color shading" instead of gray?
How common are SSTV transmissions?
How valuable is the new "Gateway" mode of the PK?

Do most people find 18k to be adequate RAM?
Are there any features that make one unit significantly better than the other?
Are there any glaring problems with either?

The salesman at the local HRO was *very* pro-PK. He strongly recommended it over the MFJ. His explanation was that it was a much better designed TNC, with a lot of support from AEA and amateurs. He claimed the filtering and reception on the PK-232 was superior to the MFJ. I don't have any reason not to believe him, but I'll take an unbiased group opinion from the net over HRO's anyday.

I'll be reading this group carefully, and will post a summary of any responses I get via e-mail. Thanks in advance!

On my local nodes I have explicit route and arp entries for all calls
accessible off the node. I don't think it can handle sending an arp
request to find your call to send you the ping response. Using the block
function as you show is OK for routeing, but not for the final hop to
many users.

1444. Re: 9600 Baud and Mitrek radio...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-14 16:18:41 UTC
From: brian@nothing.ucsd.edu
Message-ID: <2r2tl1$kg5@network.ucsd.edu>
Source record: 49289

The receive audio is available unfiltered but buffered on pin 11 of the front panel control connector.

The Mitrek *IS* a varactor-modulated radio. Just cut the lead feeding audio into the channel element (lift R505, as I recall), and shove the output of the modem into there.

You can feed the TX audio into the unused pin 18 (the blank fat one) for a seamless installation. I have about a dozen of these in service in precisely this way.

1445. PK-232MBX vs. MFJ-1278B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-14 18:23:48 UTC
From: denglet1@iia.org
Message-ID: <2r34vk$3lc@mary.iia.org>
Source record: 49140

ST>narrowed it down to the MFJ-1278B and the AEA PK-232MBX. I'd love to

I have the MFJ1278B. This is the only TNC I have had, so I can't really
compare.

ST> "random code generator" (?)
This random generator allows for practicing CW. I have never used it.

ST>Is the MFJ fax really full-color, or is it "color shading" instead of gray?
I think it depends on the transmission mode????

ST>How common are SSTV transmissions?
Common enough on 14.230, if you are looking foor SSTV you will
usually find some there.

ST>Do most people find 18k to be adequate RAM?
I assume this is on the mailbox? The minimal I got on the 1278B
is plenty enough for me. I think it is 16K? Thats 16K worth of
messages sent to your mailbox. Depends on how much mail you get
and how often you want to review/delete your old mail.

ST>Are there any features that make one unit significantly better than the othe
ST>Are there any glaring problems with either?
I have had some problems with the MFJ during Pactor, which is
my favorite mode. The tnc will occasionally lockup. I seem to have
more problems than others on the band during my links. So much of
this may be from problems in my station setup, RFI etc.
If I would have doled out the $59 for the MFJ program that supports
the tnc I might feel better. The reason I went with the mfj was for
sstv and not having the supporting program makes this almost
impossible. I am trying to write some software to display the
pictures myself, but it is slow going. If you get the mfj I would
strongly reccommend getting the supporting program. It is an extra
$59 but will allow you to receive sstv/fax with real-time display.
Reports on the rest of the mfj terminal program I have heard are not
too good. But you can use most other shareware type software for
packet/p[actor/rtty/etc. To date I have not seen any software that
supports the mfj sstv/fax modes. I have used LanLink for the other
modes, and it supports the mfj very well.
My packet reception on 2 meters is not as good as it should be. I only
receive packets if I get a full scale signal. My 2m reciever has 5
bars indicating signal strength, and I do not receive good packets if
only two bars are lit. I think this is more a problem with my tnc than
with mfj tnc's in general, since another ham I know, who has an
mfj1278 (no B) told me I should be recieving packets with that type of
signal strength.

I have talked with mfj tech support about 3 times. Once was on the lockup problem and they immediatly sent me a revised eprom, no questions asked except for my mailing address. I received the new eprom about 3-4 days later. I had to ask twice for specs on the sstv formats for writing my own p[rogram. I think the first request which I made at the same time as the eprom revision got lost. The second request was responded to promptly. I received a disk within a week. Overall I would rate the dealings I had with their tech support as excellent. It is hard to get through to them at first, (phone busy, 800 number always busy) but once I did, they took care of me.

ST>better designed TNC, with a lot of support from AEA and amateurs. He
ST>claimed the filtering and reception on the PK-232 was superior to the
ST>MFJ.
There are a lot of PK232 users out there I have linked with. Very few mfj users. I have linked with about 5 - 6 mfj 1278b hams. If I remeber right, they all reported the lockup problem in Pactor similiar to mine. This lockup is more frustrating than devasting. When it happens, I turn the tnc on/off, re-enter my callsign, and re-link. I don't know if the AEA has a similiar problem.

Didja look into the KAMS at all? Reports on the new GTOR mode sound really good. I dunno if MFJ or AEA are planning (or even can if they ant?) on adding this mode or not?

Hello: Does anyone could give any information about the next software:

Apple Macintosh:
- Macket
- MacPacket
- MacRATT
- MacTTY
- MFJ-1287

IBM PC:
- Aries-1 Packet Terminal Program
- arp TRM2 PAC PRO
- CompRtty Pacterm
- DIGIPAC I / DIGIPAC II Pak-Comm
- Ham-Com PC-Packet
- Hamcom PC-Pakratt
- Ham-Pak PK232Com
- Kanterm-PC RTP
- Lan-Link WB8COX
- MFJ-1284 WD6FPY
- YAPP

If you know one o more of these software, please give me a reference..

Eduardo Millar C.
email:plazaip@enlaces.ufro.cl

X1J will not respond to pings at all.

> are for local users?

Not sure I really understand your question Pete. I was having some trouble
myself with some X1J stuff late last year. Turned out to be total cockpit
error.

A few you may want to add to your list is:
0.0.0.0/1 (to wherever your IP gate is)
128.0.0.0/1 (again, to wherever your IP gate is)

Keep in mind that the X1J is not a full implementation of NOS. It won't
ask for ARPs, nor can you ping it. There is just not enough room in the
ram for all the code.

If you are wanting something a bit more NOSish, try a Gracilis PacTen.
We have one on our network and it is truly an amazing device.

Has anyone had any experience in utilizing the Soundblaster 16 card with the current version of JV-Fax (6.0/6.2)? It apparently will work with other sound cards with little problem but so far we have not had any luck with the S.B. cards. Any help would be greatly appreciated.

Thanks and 73

The DSK is a TI Evaluation board for the TI TMS320C26 Digital Signal
Processor Chip.

The board is about 2 inch by 3 inch and is external to the PC. It has
2 rca jacks, one for input and one for output. There is a 9 pin
connector for a serial connection to a PC. It needs 9v AC at .5 amp
power supply (available from Radio Shack).

The kit comes with an assembler and a debugger.

There is some public domain software around that will make the
DSK be a Packet/Amtor, modem as well as a noise/cw filter.

You can load the software and play or you can learn to program a DSP.

Costs about $99.

No, it is a little to expensive. But I do use a v.nice program called Xplore, that is shareware written by a member of the San Francisco State University faculty. V.fast, all the higher math functions, large number handling.

BTW, rec.radio.amateur.digital.misc? Oh, 'digital' like 'digits=fingers' right? ;)

Oh yes it will. Or should I say all the X1G/H/J nodes in service around
here will all return pings. The G/H versions had some funnies with
'long' pings but AFAIK X1J sorted them all out.

If it won't return a ping then you have set it up wrong.

It's a DSP Starter's Kit (thus DSK) from Texas Inst. It's s small PCB
all assembled with a C26 (and now C50), AIC and glue chips that combined
with available PD software gives you a RTTY Amtor Pactor system or a
audio filter. The kit comes with manuals and develeopment s/w. Get it
from Arrow for $99.95

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

From: dmd@panix.com
Message-ID: <2r5amu$54n@panix2.panix.com>
Source record: 49152
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.packet

Could someone please explain to me how to do this?
I have two machines, one running OS/2 and PMNOS, and
the other running DOS and (nothing yet).

I just want to be able to telnet, ftp, etc. from one to the
other.

They will be connected via the serial ports.

One of them is [44.68.24.33] n2sxx.ampr.org
The other is [44.68.24. 6] linkup.n2sxx.ampr.org

For a minimum of hassle, could someone please recommend
1) what NOS software I should run on the dos machine
2) would I be better off running qvt or some other windows tcp/ip
on the os/2 machine (PMNOS isn't very good)
3) please help with autoexec.nos settings to get SLIP or PPP up
and running.

Thanks very much.

I have been a registered LAN-LINK user for a few years now. It is a great program and automates many of the normal packet tasks, like getting your mail from a PBBS.

I wrote an article last year for our club newsletter that I can lookup for you if you would like. I could send it to you via e-mail.

Message-ID: <1994May15.155958.5972@vax1.mankato.msus.edu>
Source record: 49157

Hello...

The news link to my system hasn't been working properly this week. I saw from another system that somebody responded to my 9600 and Mitrek post with an offer to E-mail them, and they would tell me how easy the mods were.

Un fortunately, I don't have his/her E-mail address and the news system dunped all of the posts. Please E-mail mail if you were this individule as news on this end of the line isn't doing the job. THANKS!

Sean DJ1 @ VAX1.MANKATO.MSUS.EDU

1466. TCP/IP freqs in Bay Area

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-16 00:04:29 UTC
From: n1gak@netcom.com
Message-ID: <n1gakCpvC7H.I7w@netcom.com>
Source record: 49161

After a lengthy hiatus (brought about by moving my computer from the room near the radio) I'm back on the air.

In a word: 1200 bps == stupidest-idea-ever-conceived.

I have three questions:

1) Is there a 9600 bps channel in the bay area?

2) What do I need; this is actually a more generic question, perhaps a FAQ; what are the various 9600 bps formats used on the air, and what are their [in]compatibilities?

3) Is there a mailing list for bay area TCP/IP enthusiasts?

Scott

1467. Re: Help: Routing with X1J

Newsgroup: rec.radio.amateur.digital.misc

>> a 'ping'.
>
> X1J will not respond to pings at all.

Actually Randy, I solved the problem yesterday afternoon and I can get a ping back from the X1J. But it isn't tidy. As I mentioned, the X1J node HAN-7 that is next in line from USR-7 (i.e. me <-> USR-7 <-> HAN-7) does respond to a ping and return an echo reply back to USR-7. But USR-7 wouldn't then send the ping to me. Problem is that there must be an ARP entry specifically for my call/address and a route that covers my address. So the following will make USR-7 respond to my ping:

```
ipr 44.135.128.0/24 + 0
arp 44.135.128.1 + p ax.25 ve5va dg
```

If the arp command isn't there then it won't reply to the ping.
I now have our nodes set up so that I can ping them all - even the back-to-back ones.

The implication of the above is that for every user who is local to USR-7 and who should receive IP packets from it, there must be an arp entry with their callsign and the iproute command to shove the packet out of port 0.

Douglas Fajardo (dfajardo@netcom.com) wrote:
: Has anyone done an on-the-air comparison of the thruput of G-TOR vrs
: PACTOR? If such a comparison has been published, where can I get a copy?
:

GTor has been shown to be VERY impressive when the band is in good condition. These tests were run over both 20 and 80 meter links from Puerto Rico to Ohio and from a 400 mile 80 meter path. However, under poor condions (as occurs when a line of storms are approaching) GTOR was lousy.

One answer to this is to utilize both GTOR and Pactor. When the band is good, utilize the speed of GTOR. When the band falls out, go back to Pactor. This requires two KAMs in parallel. A bit pricey when you need a third on the road. Another possibility is to connect via Pactor and reformat the port to GTOR. This is proving too much of a pain.

It was not unusual at all to not be able to even get in via GTOR but be able to hold a slow but steady Pactor connect. This was seen on about one in five days.

I need to get in so as it now sets, the port remains in Pactor. Maybe a future release will allow both Pactor and GTOR connects rather than one or the other. With the GSCAN command all the pieces parts for such a resolution are there. If both were available, a station could choose their link depending on band conditions.

Recently, I posted some short PD IBM pc programs to the amateur radio packet BBS network. Used UUENCODE. Posted the ASCII version of UUDECODE earlier. Recieved a reply that, in Europe and elsewhere, people use "7plus" instead of UUENCODE and UUDECODE to prepare binaries for transport in an ASCII network. Where can I get this "7plus" program, for an IBM pc DOS machine? ftp site?

The firmware with built-in KISS came along a bit later than that, I think. You can get a firmware upgrade from MFJ or TAPR, but will also need to upgrade from 16K to 32K of RAM to use the newer firmware. If you only want to use KISS, you can get a KISS eprom from TAPR, which will work with 16K or 32K. MFJ and TAPR also have the RAM chips to do the memory upgrade. If you have the capatility to make your own EPROMs, TAPR has a disk with the rom images and a bunch of other stuff for $3.00.

Yeah Dave, I apparently did have it set wrong. N7OO sent me mail about this Saturday night. I looked at the instructions and redid one of the nodes yesterday. It did ping. I stand corrected.

Out of curiosity, what experience do you have with the X1J v2 code? We just got the code here in the KC area and are getting ready to blow new eproms this week.

Viva la X1J! Viva la Gracilis!

Source record: 49171

Is there anyone using an FT-726R and 9600 baud modem? I'm trying to find the easiest and safest way to connect my G3RUH modem to my FT-726R. I've found the output of the demodulator for receive that is easy to access, but haven't found a similarly easy spot for injecting the xmit side into the modulator.

If anyone knows of the easiest (least impact on the FT-726R) way to connect up a high speed modem, I'd sure like to hear about it.

Simplest way I can think of is to use a pre-made A/D converter and sample the
audio output jack of the radio. This would be a cool way to get random numbers
too... (if it worked)...

I'm sure the A/D converters exist, and I've seen an RS232 chip which would let
you send your output to the mac via the serial port. My guess is that the best
way to do it would be to have a poll/response method, where you send a request
through the serial port to the box and have it sample the line voltage, then
send the value back. That way you can keep track of the time via the computer.

good luck,
Dan

Yeah, that is the one problem with X1J nodes. Other than this, they are
perfect. Guess the real thing to do is have one station per frequency/node
act as an IP router.

Not installed v2 anywhere yet - I have the stuff but I haven't been to
any of our remote sites for some time. Currently our local network is a
mix of X1G, X1H and X1J and BPQ nodes, and while they work I tend to
leave them alone (one site has kept its TNCs running for over 10,000
hours without a crash or power fail). I will get round to updating to
X1J v2 sometime though :-)

I need information on basic netrom chip burning. I have all the
paperwork on TheNet X-1J Release 2 but they do not say how to burn
basic EPROMS. I have sent my $15 to the North East Digital Assn,
Manchester NH for their TheNet X-1J network guide but nothing
received yet. I'm more than a little miffed at the lack of help
by a certain SYSOP on the Northern Calif DX Packet network.

Any help on getting started will be greatly appreciated.

>not use the FSK capabilities of the rig - is there an advantage ?

I run (not simultaneously, of course :-) both a PK-900 and a KAM Plus
into the FSK connector of a Yaesu FT-990 both for PACTOR and straight
RTTY. No problem whatsoever.

The advantages of going this route, instead of injecting tones through
LSB are 1) the filters in the rig are properly centered, without
fiddling with passband tuning, to where the PACTOR controller wants
to see the signal, and 2) you won't accidentally have the speech
processor turned on and splatter whatever tiny RTTY subband we have.

Nothing wrong with your Omni V at all for PACTOR work. I also own
an Omni-V. Notice that the Omni performs FSK by frequency shifting
an RF oscillator, whereas a rig such as the FT-990 injects the output
from an internal AFSK oscillator into the LSB modulator. The religious
can dance on the head of a pin as to which scheme is superior :-).

Subject: AEA DSP2232 Mailing List started
To: ham-digital@ucsd.edu

Hello,
due to lack of information on AEA's DSP2232 (e.g. SSTV) I started
a mailing list on this gear :-).

If you would like to subscribe write to:

dsp2232-request@rmi.de

with "subscribe" in the subject.

If you would like to contribute information, please write to

dsp2232@rmi.de

I hope, information (and users) will start soon.

Regards,
Rupert dl3no

For DOS stuff, I would take a look at oak.oakland.edu, /pub/msdos. This
is one of the primary Simtel mirror sites, and has a lot of DOS stuff.

For Windows, try ftp.cica.indiana.edu. I don't know the directory
structure on this one, however.

Hope it helps...

Sounds like you have the "X-on/X-off" terminal data flow setting on. Try
turning it off and also set your computer for hardware flow control (aka
"RTS/CTS"). If all else fails, clear the memory in the PK232 by removing
power from the unit, then remove the battery jumper. Wait at least 60
seconds before you replace the jumper. If that does not cure the problem
and you are SURE that your cable is good, call AEA.

I have a friend who run's KaGold with a KAM+ and Likes it very much.
It supports PACTOR/RTTY/AMOTOR/ (GTOR I think) and PACKET !
I have used a version of it called TESTDRIVE for VHF PACKET and like it
But the TNC I use HAs some Limititions using Kagold.(KPC3).
I think that you KaGold is a good Choice.

To: ham-digital@ucsd.edu

I am looking for recommendations for software for the KAM Plus. My
primary interest is HF communications modes, PACTOR/RTTY/AMTOR/GTOR.

I understand Kantronics makes something called Hostmaster II, plus I've
heard mention of a package called KAMGold.

Feedback would be appreciated?

To: ham-digital@ucsd.edu

I know of no combination of keys to accomplish KISS mode if it is not included in the ROM version in the 1270. However, I'm fairly sure you can still get a new ROM with the KISS command from MFJ.. I did about a year ago for the same reason. Give them a call and I think they can solve your problem..

-> Has anyone had any luck using this radio and TNC? I seem to have
-> trouble with the 440's discriminator (marked FSK on board) output
-> driving the NB96's receive audio.
->
-> Any sage advice/observations appreciated to brownell@tigger.jvnc.net.
-> Thanks.

Having recently done several diff. IF interfaces, my guess is you have an impedance mismatch between your discriminator and the front end of the 9600 modem. You should be connecting on the side of the discriminator that leads to the AF section. Try a 5 MFD non-polarized capacitor in series with the modem and the IF.

This particular problem has driven me nuts several times. While the modem mfg. will claim that his modem has a very high impedance IC (like a TL082) as the frontend, you will notice that they often use a 5-10K resistor as a pull up curcuit on the input side of the TL082. This completely drives the discriminator curcuit to zero. You need to eliminate that DC component.

hi, mitch wa4osr here in mobile, alabama...

my sharp pc-6200 was dropped and the lcd display
was damaged... upon taking the display apart, one
of the surface mount column drivers was cracked...
rendering the display unusable... therefore,
i am in desperate need of the lcd display panel...
the part numbers on the display panel are LM64N671
and 90D13145W ... both numbers are on the panel...
my pc-6200 is actually a pc-6220, which
i think indicates that it has a 20 mb hard drive...

i bought the pc-6220 used with absolutely *NO* docs...
it has the 2400 baud internal modem... i need *ANY*
info, but especially would appreciate a copy of the
owner/operator manual... i will gladly pay for
copies/postage...

if anyone can help with a source of the lcd panel or
with the docs please email me or call me collect
at the below numbers...

thanks for any help/leads...

James,

I don't know much more than a tame crow, but...

Well, I'm about to do the same thing myself, so maybe we can help each other. The reason that there is no information provided is probably because it depends upon the EPROM burner that you are using. The one I use simply takes an image file and burns it into the EPROM. First, however, I think you have to use the editor to set those parameters which go in the EPROM. I just got X-1J R2, and haven't looked at the tools (if any) which come with it.

Maybe someone who knows something will join in here.

Source record: 49185

Hello, I was wondering if anyone has tried (or preferably has a list)
of the packet to Internet gateways that seem to exist.

On the Internet, telnetting to

af2j.ece.psu.edu
ke9yq.imsa.edu
hpcsos.col.hp.com
and several others, some go up and down!

will give a login. The ke9yq one allows anonymous login and appears to
let to AX.25 and NET/ROM out on amateur packet! (You need to register
to do this.)

Access to far off BBS's and chat nodes would become far easier if more
gates like these were known of. The current method for me is four or five
node hops across the UK to the LONNY wormhole, so I can then connect out
to the USA, but this is so SLLLOOOWWW and unrealiable. It is the same sor
sort of route for the International Chat node, and I would like to be able
to chat to amateurs wordwide without all of that hassle!

Does anyone have any more info?

Thanks, de Lee Volante, G0MTN

Packet: G0MTN@GB7XJZ.#48.GBR.EU Email: ljv@soton.ac.uk

1493. PacTOR FEC timing/format issue

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-17 16:15:40 UTC
From: khopper@kimbark.uchicago.edu
Message-ID: <1994May17.161540.25823@midway.uchicago.edu>
Source record: 49186

I recently completed testing a TI-DSK DSP module running the exciting new HB9JNX software, "TERM".

When transmitting a CQ in FEC mode the actual signal had ARQ timing and sounded like a QSO instead of the more familiar higher speed stream of AMTOR and PacTOR FEC sigs. A contact in FEC mode QSO on 20M confirmed that it looked and sounded very strange to K7RD.

I inquired with the author, Tom Sailer, and he responded that the DSP based code was operating AS IT SHOULD - i.e. per the SCS specification. He further asserted that the ARQ timing (chirp...chirp...chirp..) enabled the listening station to actually SYNCHRONIZE with the CQ instead of just hoping to catch a strong enough sig and see what was being xmitted.

This is the first time I encountered this issue. All other PacTOR stations that I have worked used the stream FEC mode. I have not worked an SCS equipped station and can't verify that they operate in this same manner. Would anyone care to comment on this. If SYNCHRONIZATION is the proper method, then why haven't other TNC mfgrs used that technique ?

I think that because I have been trained to listen for the stream FEC I simply bypass those stations that sound like ARQ mode xmissions. This means that if I heard the ARQ rythm I would assume that due to propagation I couldn't hear the other station and move on. As an xmitting station I wonder if I would ever get an answer to my CQ :?)

1494. PacComm Micropower-2 -> Realistic HTX-202?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-17 17:08:08 UTC
From: drenze@icaen.uiowa.edu
Message-ID: <2ratlo$qj4@news.icaen.uiowa.edu>
Source record: 49005

Does anybody happen to know the cable configuration to hook the
PacComm Micropower-2 (it's basically the Tiny-2 TNC) to the
Realistic HTX-202? I picked one up cheap, but it was without
any docs (the TNC). I've ordered them, but would sorta like to
get on the air ASAP--dunno when everything'll be coming in. Also,
if you have an online version of the command set, I'd be obliged.
From what I can tell, some of the "standard" TAPR-2 commands don't
really seem to work, and I have no idea how to access the PBBS.

Tnx es 73 de Doug N0YVW

Your modem cable should work fine. The only issue would be whether
Hostmaster needs hardware handshaking or not. I think it does. If so
you would be best to use a "High speed" modem cable, which just means
it has the hardware handshaking lines in it.

The 1278 supports SSTV and FAX, but unlike the other text-only modes where
the
1278 does all the work, SSTV and FAX require smart software on the computer
side
to transform a binary stream of nibbles into a picture. MFJ's IBM
compatible
MultiCom program supports color FAX by sending (and receiving) three
different
pictures or color separations. On the receiving end, the three pictures
are combined
into one picture again. Really, this is not much different than the way
many of the color
SSTV formats work.

Although the 1278 supports SSTV reception, all of the decoding logic is in
the
software external to the 1278. MFJ can send you technical information on
how
the 1278 sends the binary stream of data (the information is actually in
the
technical manual that comes with the 1278), but you'll have to figure out
how
each of the SSTV formats (Scottie1, Robot72c, etc.) is interpreted.

I'm the author of KAMterm. KAMterm is a (currently only dos-based)
terminal program for Kantronics TNCs that takes advantage of the Kantronics
host mode terminal interface. This mode basically allows you to do a lot
of things that you can't do in the normal dumb-terminal mode.

If you'd like more information about it, please feel free to e-mail me (be
sure to put ``KAMterm'' in the subject line---I'm ***WAY*** behind on
e-mail, but KAMterm mail always gets my fastest possible response, i.e.,
it's usually only delayed by UUCP delays...and nothing else).

Later,

Message-ID: <2rdnl6$12k@news.icaen.uiowa.edu>
Source record: 49048

I'm going to be connecting a PacComm Micropower-2 TNC to my Realistic HTX-202 as soon as I get a cable cobbled together. Does anybody know about what a good volume level for the '202 is in this configuration?

Also, what's the TX Delay for the '202. The manual doesn't seem to be of any help, unfortunately (which is too bad, considering that for the HTX-100 they mention what the TX delay is).

Tnx in advance,

Doug N0YVW

1503. 9600 bps radio modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-18 20:29:31 UTC
From: brian@nothing.ucsd.edu
Message-ID: <2rdtrb$jvc@network.ucsd.edu>
Source record: 49052

I'm disgusted with the performance of the carrier detect circuits in the three popular 9600 bps radio modems used by amateurs - the K9NG, G3RUH, and new TAPR modems.

None of these has a good carrier detect circuit. All three use a DPLL to discover that there's a data carrier out there, which doesn't really work very well. Those circuits chatter; they occasionally false on background noise, and can be fooled by interference of various kinds.

The K9NG design doesn't do much about that; its DCD output just chatters. If you use it to gate data to the USART in the attached TNC or PAD, you lose perfectly good packets because the DCD chattered off in the middle of a packet. If you use it to key your repeater TX, the radio will thrash all the time because of the false DCD indications.

Sure, in the G3RUH and TAPR modems, additional circuitry has been added to prevent the thrashing, and the output of the DPLL is "smoothed" to eliminate most of the chatter, but there is still one big remaining problem:

They're SLOW!

These things are taking between 50 and 100 msec to indicate an incoming carrier. That's longer than some of the packets. Waste of bandwidth.

I'd really like to come up with some sort of better DCD - and it wouldn't hurt if it had better data recovery performance as well.

Sure, the right answer is DSP. N4HY will tell you that, and I agree. But short of that, is there some approach that'll help?

(Being compatable with the scrambled direct FSK that the current modems use would be a plus, but isn't required.)
- Brian

I think Bob meant to say 145.75. But you can't do 9600 on it, of course.

Dennis N6NG told me recently that some 9600 activity is starting on
433.430 MHz.

> iliar higher speed stream of AMTOR and PacTOR FEC sigs. A
> contact in FEC mode QSO on 20M confirmed that it looked
> and sounded very strange to K7RD.
>

I have the SCS Pactor spec; there is no spec on block repeat time for
Pactor FEC. The two units that I have tested (PK232 and SCS) both repeat
the FEC block with a 1 sec period. However, in talking the SCS people
at Dayton, their intent was to use a correct CRC as the sync indicator
rather than locking to a particular transmit time, as you do in an ARQ
link. With the frame header character that they have selected, it makes
it real hard to sync on the front end of the block.

Source record: 49057

I just bought a HTX-404 from er, ah.. Radio Shack, and knowing that they are made by ICOM and noticing that the battery pack looks the same, I asked the GBTC (Guy Behind the Counter) about whether I could use my ICOM battery packs on it. He said no, that if you use a higher voltage battery pack (for instance a 12 volt one) it "would burn out a little diode inside the radio"..

Anybody know whether this is true? If so, it seems like a collosal design blunder, especially seeing as how there is no warning in the user's manual telling you not to do this!

Since this request falls under both digital communications and equipment,
I'm crossposting -

I'm budgeting for a multi-mode, and am eyeing either the AEA PK232MBX or
the AEA PK900. What are the comments pro/con with each?

How about comparing/contrasting them with the Kantronics KAM Plus.

I'm looking for people's experiences with performance AND reliability for
the price. For now, I plan on doing a lot of receiving.

Additionally, can any of the above units receive the 137Mhz NOAA weather
satellites? If so, what is/are the requirement(s)?

Thanks for any info you can provide.

I will summarize if I get enough responses.

Scott

1510. Baycom circuit?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-19 04:44:00 UTC
From: darryl.linkow@ledge.com
Message-ID: <cf.1168.435.0N2EEAFD@ledge.com>
Source record: 49051

I have downloaded the Baycom software and read the manual. From what I can understand, this software let's me use do packet without a TNC. What I don't understand is how I connect my HT to my computer. The manual shows some inputs to a serial port, but don't I need a modem as well? Also, there is something about a small circuit board to interface the radio to the RS-232 port. Anyone have any info on this? Also, is anyone using Baycom? If so, are you happy with it? Or should I spend a bunch of money and buy a TNC? I am new to ham radio (I am still waiting for my license, 7 weeks now!) and don't know if I will like packet, so I am looking to get my feet wet at a low cost, to see if I like it. Any info would be appreciated.

There was something here recently about getting TheNet X1J code into
EPROMs which I passed on to G8KBB (the author). The original's gone
(things last a max of 36 hours here if you're lucky) but here's his
reply to who ever it was.....

James is quite correct when he notes that all programmers are different.
It is exactly for that reason that no guidance is offered. There are
however the following:

A utility to convert the ROM images to INTEL hex (source + exe)
A utility to convert the ROM images to Motorola S (ditto)
A patch utility that is used to customise the ROM image, with
on line help and ability to save/load standard settings.
A configuration guide for manual patching if you must do so
A couple of examples of how to use the tools.

daryll -

i'm new to packet and i am using a baycom. i bought the software and modem
for $50, more or less. yes, you need a modem to interface your radio to
the computer. the circuit of baycom's modem is available (i think) on some
boards or you will find adds for baycom in qst.

it seems to work fine, at least for the stuff i use it for. it seems a
cheap intro to packet.

1513. CISCO Router to Gracilis PackeTen

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-19 16:43:19 UTC
From: jdurand@mitre.org
Message-ID: <2rg4v7$o0h@linus.mitre.org>
Source record: 49055

We have been expirimenting with linking LAN's together using CISCO's and Gracilis PackeTen's over low-speed (2400 baud) half-duplex radio networks. We are using the Gracilis to interface to a number of military radios. We are trying to show how hosts on the battlefield in mobile platforms (ie vehicles) can be internetworked using commercial technology with existing military communications systems.

Our network looks like this:

```
SLIP ------------ AX.25 ----------- SLIP
| | | |
v v v v
Cisco---Gracilis---Radio---> <--Radio----Gracilis---Cisco
508 Packeten ^ Packeten 508
| | |
| | |
---------Ethernet----- | ----Ethernet-------------
| | |
Host 2400 baud half-duplex Host
(SCO Unix) (SCO Unix)
```

I'm looking for others who have experience linking CISCO's to the Gracilis, to share ideas/problems/solutions.

Thanks in advance.

Mike,
No, you can't put the ICOM 12 volt pack on the HTX-404. It would
probably work for a while but it would cause serious overheating of
a regulator that was designed to work with the stock battery pack.
Yes, you are right, it is a serious booboo. By the way, it is not
an ICOM rig, it is Midland. Unless of course, ICOM makes it for Midland
who then puts Radio Shack on the label.

Out here, the AEA's are losing ground to the KAM+. You may want to give it a closer look, now that G-TOR is here. Haven't used it myself, but I've heard many good things about it's efficiency. Check out PKGold for the AEA and KaGold for the KAM. This is host-mode software that is definately worth considering.

Daniel,
I caught your broadcast response offering info. on above subject.

I'm looking for interface info on adapting the Mitrek and Micor radios to 9600 baud use. Specifically, the modem interface and full duplex modifications.

I would appreciate you forwarding any info you have. I am forming a conference and file area on my ham radio BBS dedicated to 9600 packet. Perhaps, this will make it easier for hams to complete the interface in the future.

Regards,
Steve Diggs,KB4ZTN

Brian,

I appreciated your msg., as I have been working steadily over the past 13 months to get 9600 packet working for one of our LAN groups here in Atlanta, the East Atlanta LAN. It's tough, really tough. I'm presently experienced with the MFJ1270 and their kit, a G3RUH actually made by Paccomm, and a TAPR 9600 kit, which I installed in my PK232MBX. Each has some uniquely good and bad qualities. I can't really say that sloppy DCD performance has been at the core of it; or at least at my experience level I don't think it has.

-> work very well. Those circuits chatter; they occasionally false on
-> background noise, and can be fooled by interference of various kinds.

I haven't seen either the G3RUH or the TAPR modem false indicate DCD, even once. I've seen it not pick up valid data (or so it looked to me) but not false.

I've been trying to work simplex right now; we don't have a full duplex repeater up yet; so we're limited to that. Also, I'm experimenting with half-duplex without a repeater.

I'm at the state where I can get each system to regularly decode another's beacon text, I can connect dependably (with an average of 1-2 retries) yet when I use mailbox features to simulate more robust traffic, often I get into retry hell. How can that be? How can I read a beacon great, connect great, just not put any meaningful amount of data through? Any ideas?

Regards,
Steve Diggs, KB4ZTN

Official word from a Radio Shack VP is that the radios are *not* made by Icom. They are manufactured to RS's design by an unspecified Korean company. However, Icom battery packs of the IC2 generation will fit and work.

My opinion now. I wouldn't use a 12 volt pack unless I was sure it was safe. I know the standard Icom packs work fine. I *think* it's OK to use a 12 volt pack unless you try to run the radio off external power or charge the battery *through the radio*. I *think* you can use the 12 volt pack if you always charge it while *off the radio* in an Icom drop in charger, but I haven't actually done that.

I have acquired an ancient(?) AEA CP-1 Computer Patch for RTTY and CW. It came with a cartridge for RTTY/CW and another for AMTOR, both for the Commodore C-64 computer. If anyone has instructions for using the AMTOR cartridge (I have instructions for RTTY/CW) for the C-64, and any information about software to use this thing on an IBMPC clone please email me or post to this newsgroup.

Thanks, Tom Graham - N6WLF

>Sure, the right answer is DSP. N4HY will tell you that, and I agree.
>But short of that, is there some approach that'll help?

>(Being compatable with the scrambled direct FSK that the current modems
>use would be a plus, but isn't required.)

What's wrong with using a squelch-derived DCD? It's possible to make a
squelch that's fast and reliable -- in the Kantronics D4-10, the squelch
response time is <well> under 10 milliseconds, and it is very solid.

Is it really true that normal VHF radio squelches today are horribly slow?
Has anyone measured the squelch speed of popular radios being used for 9600?
It may be that even the slower ones could be made acceptably fast by clipping
out a capacitor or two...

I've always questioned the idea that you want a digital DCD so that
other signals on the channel won't hold off transmission. First, if you
transmit over the top of someone because your DCD doesn't happen to respond to
their modulation scheme, there's a question of deliberate interference. But
more practically, if the signal is strong enough to override a reasonable
squelch setting, the chances are it's going to stomp on your packets, anyway.

>
Darryl, as you have already said, it takes a modem to make Baycom
work. It is a fairly simple device which is often packaged inside
the housing of a 25-pin RS-232 connector.

Check QST 6/94 issue, p140 for Tigertronics add of BayPac BP-1.
(800)822-9722.

Also, PacComm has a BayMod-9 and BayMod-25 (9 or 25 pin RS-232)
(800)486-7388.

There are many of these in use and they are thought to be a good
way to get started. Many users go no further. Cost is about $50.

daryll -

i'm new to packet and i am using a baycom. i bought the software and modem
for $50, more or less. yes, you need a modem to interface your radio to
the computer. the circuit of baycom's modem is available (i think) on some
boards or you will find adds for baycom in qst.

it seems to work fine, at least for the stuff i use it for. it seems a
cheap intro to packet.

I'm going to be connecting a PacComm Micropower-2 TNC to my Realistic HTX-202
as soon as I get a cable cobbled together. Does anybody know about what a

good volume level for the '202 is in this configuration?

Also, what's the TX Delay for the '202. The manual doesn't seem to be of
any help, unfortunately (which is too bad, considering that for the HTX-100
they mention what the TX delay is).

Tnx in advance,

Mike,
No, you can't put the ICOM 12 volt pack on the HTX-404. It would
probably work for a while but it would cause serious overheating of
a regulator that was designed to work with the stock battery pack.
Yes, you are right, it is a serious booboo. By the way, it is not
an ICOM rig, it is Midland. Unless of course, ICOM makes it for Midland
who then puts Radio Shack on the label.

Kevin

I have the SCS Pactor spec; there is no spec on block repeat time for
Pactor FEC. The two units that I have tested (PK232 and SCS) both repeat
the FEC block with a 1 sec period. However, in talking the SCS people
at Dayton, their intent was to use a correct CRC as the sync indicator
rather than locking to a particular transmit time, as you do in an ARQ
link. With the frame header character that they have selected, it makes
it real hard to sync on the front end of the block.

James,

I don't know much more than a tame crow, but...

Well, I'm about to do the same thing myself, so maybe we can help each
other. The reason that there is no information provided is probably because
it depends upon the EPROM burner that you are using. The one I use simply
takes an image file and burns it into the EPROM. First, however, I think you
have to use the editor to set those parameters which go in the EPROM. I just
got X-1J R2, and haven't looked at the tools (if any) which come with it.

Maybe someone who knows something will join in here.

Subject: 9600 bps radio modems
To: ham-digital@ucsd.edu

I'm disgusted with the performance of the carrier detect circuits in the three popular 9600 bps radio modems used by amateurs - the K9NG, G3RUH, and new TAPR modems.

None of these has a good carrier detect circuit. All three use a DPLL to discover that there's a data carrier out there, which doesn't really work very well. Those circuits chatter; they occasionally false on background noise, and can be fooled by interference of various kinds.

The K9NG design doesn't do much about that; its DCD output just chatters. If you use it to gate data to the USART in the attached TNC or PAD, you lose perfectly good packets because the DCD chattered off in the middle of a packet. If you use it to key your repeater TX, the radio will thrash all the time because of the false DCD indications.

Sure, in the G3RUH and TAPR modems, additional circuitry has been added to prevent the thrashing, and the output of the DPLL is "smoothed" to eliminate most of the chatter, but there is still one big remaining problem:

They're SLOW!

These things are taking between 50 and 100 msec to indicate an incoming carrier. That's longer than some of the packets. Waste of bandwidth.

I'd really like to come up with some sort of better DCD - and it wouldn't hurt if it had better data recovery performance as well.

Sure, the right answer is DSP. N4HY will tell you that, and I agree. But short of that, is there some approach that'll help?

(Being compatable with the scrambled direct FSK that the current modems use would be a plus, but isn't required.)
- Brian

I'm the author of KAMterm. KAMterm is a (currently only dos-based) terminal program for Kantronics TNCs that takes advantage of the Kantronics host mode terminal interface. This mode basically allows you to do a lot of things that you can't do in the normal dumb-terminal mode.

If you'd like more information about it, please feel free to e-mail me (be sure to put ``KAMterm'' in the subject line---I'm ***WAY*** behind on

e-mail, but KAMterm mail always gets my fastest possible response, i.e.,
it's usually only delayed by UUCP delays...and nothing else).

Later,

Subject: HTX-404
To: ham-digital@ucsd.edu

I just bought a HTX-404 from er, ah.. Radio Shack, and knowing that they are
made by ICOM and noticing that the battery pack looks the same,
I asked the GBTC (Guy Behind the Counter) about whether I could use
my ICOM battery packs on it. He said no, that if you use a higher voltage
battery pack (for instance a 12 volt one) it "would burn out a little diode
inside the radio"..

Anybody know whether this is true? If so, it seems like a collosal
design blunder, especially seeing as how there is no warning in the
user's manual telling you not to do this!

Not installed v2 anywhere yet - I have the stuff but I haven't been to
any of our remote sites for some time. Currently our local network is a
mix of X1G, X1H and X1J and BPQ nodes, and while they work I tend to
leave them alone (one site has kept its TNCs running for over 10,000
hours without a crash or power fail). I will get round to updating to
X1J v2 sometime though :-)

Subject: XIJ and programming support
To: ham-digital@ucsd.edu

There was something here recently about getting TheNet X1J code into
EPROMs which I passed on to G8KBB (the author). The original's gone
(things last a max of 36 hours here if you're lucky) but here's his
reply to who ever it was.....

James is quite correct when he notes that all programmers are different.
It is exactly for that reason that no guidance is offered. There are
however the following:

A utility to convert the ROM images to INTEL hex (source + exe)
A utility to convert the ROM images to Motorola S (ditto)
A patch utility that is used to customise the ROM image, with
on line help and ability to save/load standard settings.
A configuration guide for manual patching if you must do so
A couple of examples of how to use the tools.

Gary
The HTX 202 and 404 do not charge the battery pack through the ext dc connection on the top deck. HT's that do charge their batteries this way have three battery contacts. The HTX radios have only two contacts and a diode is in series to prevent current from flowing the wrong way. My reading of the dashed line sections on the schemetic was that the regulator is in the battery pack and the connections from the battery pack is the same as from ext dc pwr.
(I tried to order the service manual but they sent me an enlarged instruction manual. I returned it and never heard from them again.)

There are two programs that I know will work... One is TOR... I don't remember the version... I think the last was TOR30x.ZIP... This was shareware... I also forgot the author...

The software that I use is BMK-MULTY... I am using a HAL CRI-200 modem... BMK-MULTY, written by G4BMK, is the ultimate RTTY/AMTOR/PacTOR/CW software for dumb modems... While the initial cost is high, and the software is not resaleable, because it is encoded with your callsign, it allows the use of simple, good and affordable old-style HF modems... Upgrading your modem is then relatively easy...

Check the back of QST for info on BMK-MULTY...

Has anyone here hooked up a Kenwood TR-7400A to a PK-88? I checked in the
manual for the PK-88 and it looks like I csan use the mike connector as the
standard 4 - pin connection given. It seems a bit generic to me and I'd like
to confirm it before I buy a connector and create smoke. I also noticed and
external speaker jack and a tone pad connector. Could these be used?

>
>Out here, the AEA's are losing ground to the KAM+. You may want to give it
>a closer look, now that G-TOR is here

GTOR is a very good mode but it is KAM specific. The ratio of PK232's
to KAM's is better than 3 to 1 (based on QSO records , over 2000
log entries), and the front end of the 232/900 is far superior to
the KAM (have a KAM, MFJ-1278, PTC, PK232 and PK900). I had
to buy a Timewave DSP9+ before the KAM was usable for pactor and GTOR,
the 232 and 900 were at least a factor of 2X better as far as
noise and QRM were concerned.

>Check out PKGold for the AEA and KaGold for the KAM. This is host-mode
>software that is definately worth >considering.

Gold is not the only game in town, XPCOM (twin tnc) for the PK232 (host)
and TNC, XPKAM (host mode for KAM), and XPDUAL (PK900/DSP2232 Host),
ACUTERM and others are also out there offering as much or more
for a heck of a lot less!!

>I asked the GBTC (Guy Behind the Counter) about whether I could use
>my ICOM battery packs on it. He said no, that if you use a higher voltage
>battery pack (for instance a 12 volt one) it "would burn out a little diode

The schematic of the HTX 404 shows that both the battery and the external
power jack are isolated by the same kind of diode from the rest of the unit.
The only difference is an inductor and a capacitor in the battery pack line.
But I don't see how applying 12 volts from the battery pack would be different
from using an external 12 volt supply.

```
external d.c. jack + o-----------------------|>|--------o-------> to radio
D4 1N5819 |
|
battery pack + o----UUUU----------o----|>|--------|
L9 4.5 uhy | D5 1N5819
|
C44 .001 ===
|
///
```

The battery pack has a lot of circuitry inside to regulate the charge, but
that shouldn't affect anything in the rest of the unit.

disclaimer: I think I know what I'm talking about, but of course I take no
responsibility for the consequences if you believe me.

Message-ID: <548.18.uupcb@totrbbs.atl.ga.us>
Source record: 49080

-> What's wrong with using a squelch-derived DCD? It's possible to make
-> a squelch that's fast and reliable -- in the Kantronics D4-10, the
-> squelch response time is <well> under 10 milliseconds, and it is very
-> solid.
-> Is it really true that normal VHF radio squelches today are horribly
-> slow? Has anyone measured the squelch speed of popular radios being
-> used for 9600? It may be that even the slower ones could be made
-> acceptably fast by clipping out a capacitor or two...

We're getting the cart before the horse in this message thread. 9600
packet is an IF interface; squelch control is a AF section function. The
audio at the IF is always unsquelched, and rightly so. Further,
<anything> do to with the AF section screws 9600 transmissions up due to
the normal pre-emphasis and de-emphasis curcuitry in the AF section. It
seems that 9600 packet audio requires it's own custom de-emphasis based
on the exact discriminator used in order to get the eye pattern right to
the modem. Hence the difficulty of getting the IF interface right.

So...bottom line is...doesn't matter how fast/slow the squelch
is...you're way on the IF side of the squelch curcuit anyway.

I clearly state here that this is an area for ongoing discussions, as I
am not satisfied with the work I've done so far in 9600 packet, so any
help/comments/objections is appreciated.

What's wrong with using a squelch-derived DCD? It's possible to make a
squelch that's fast and reliable -- in the Kantronics D4-10, the squelch
response time is <well> under 10 milliseconds, and it is very solid.

Is it really true that normal VHF radio squelches today are horribly slow?
Has anyone measured the squelch speed of popular radios being used for 9600?
It may be that even the slower ones could be made acceptably fast by clipping
out a capacitor or two...

I've always questioned the idea that you want a digital DCD so that
other signals on the channel won't hold off transmission. First, if you
transmit over the top of someone because your DCD doesn't happen to respond to
their modulation scheme, there's a question of deliberate interference. But
more practically, if the signal is strong enough to override a reasonable
squelch setting, the chances are it's going to stomp on your packets, anyway.

Darryl, as you have already said, it takes a modem to make Baycom
work. It is a fairly simple device which is often packaged inside
the housing of a 25-pin RS-232 connector.

Check QST 6/94 issue, p140 for Tigertronics add of BayPac BP-1.
(800)822-9722.

Also, PacComm has a BayMod-9 and BayMod-25 (9 or 25 pin RS-232)
(800)486-7388.

There are many of these in use and they are thought to be a good
way to get started. Many users go no further. Cost is about $50.

Subject: CISCO Router to Gracilis PackeTen
To: ham-digital@ucsd.edu

We have been expirimenting with linking LAN's together using CISCO's
and Gracilis PackeTen's over low-speed (2400 baud) half-duplex radio
networks. We are using the Gracilis to interface to a number of
military radios. We are trying to show how hosts on the battlefield in
mobile platforms (ie vehicles) can be internetworked using commercial
technology with existing military communications systems.

Our network looks like this:

SLIP ---------- AX.25 ---------- SLIP

v v v v
Cisco---Gracilis---Radio---> <--Radio----Gracilis---Cisco
508 Packeten ~ Packeten 508

---------Ethernet----- ----Ethernet----------

Host 2400 baud half-duplex Host
(SCO Unix) (SCO Unix)

I'm looking for others who have experience linking CISCO's to the
Gracilis, to share ideas/problems/solutions.

Thanks in advance.

Subject: ftp site to get "graphic packet" (w/ 7plus) with English doc's?
To: ham-digital@ucsd.edu

Downloaded a packet program "graphic packet" that is also suppose to
automatically identify and decode binaries encoded in "7plus".
Problem is that the doc's are in German, and very little in English.
So, I'm not sure if I can even run it on a 286 with DOS 5.0 and
an mono EGA and no windows.

Anyplace have doc.s in English? Or if it won't run on my PC, I'd
like to know that.

(Yes, I'm one of those Americans that know only one language (English),
but please realize that there are too many choices of 2nd language
and none an obvious choice, and I don't have time or ability to do
them all). :-(

Official word from a Radio Shack VP is that the radios are *not* made
by Icom. They are manufactured to RS's design by an unspecified Korean
company. However, Icom battery packs of the IC2 generation will fit and
work.

My opinion now. I wouldn't use a 12 volt pack unless I was sure it
was safe. I know the standard Icom packs work fine. I *think* it's OK
to use a 12 volt pack unless you try to run the radio off external
power or charge the battery *through the radio*. I *think* you can use
the 12 volt pack if you always charge it while *off the radio* in an
Icom drop in charger, but I haven't actually done that.

Subject: Multi-mode TNC suggestions
To: ham-digital@ucsd.edu

Since this request falls under both digital communications and equipment,
I'm crossposting -

I'm budgeting for a multi-mode, and am eyeing either the AEA PK232MBX or
the AEA PK900. What are the comments pro/con with each?

How about comparing/contrasting them with the Kantronics KAM Plus.

I'm looking for people's experiences with performance AND reliability for
the price. For now, I plan on doing a lot of receiving.

Additionally, can any of the above units receive the 137Mhz NOAA weather
satellites? If so, what is/are the requirement(s)?

Thanks for any info you can provide.

I will summarize if I get enough responses.

Scott

Out here, the AEA's are losing ground to the KAM+. You may want to give it
a closer look, now that G-TOR is here. Haven't used it myself, but I've
heard many good things about it's efficiency. Check out PKGold for the AEA
and KaGold for the KAM. This is host-mode software that is definately worth
considering.

> ST> "random code generator" (?)
> This random generator allows for practicing CW. I have never used it.
>
> ST>Is the MFJ fax really full-color, or is it "color shading" instead of gray?
> I think it depends on the transmission mode????
>

The 1278 supports SSTV and FAX, but unlike the other text-only modes where
the
1278 does all the work, SSTV and FAX require smart software on the computer
side
to transform a binary stream of nibbles into a picture. MFJ's IBM
compatible
MultiCom program supports color FAX by sending (and receiving) three
different
pictures or color separations. On the receiving end, the three pictures
are combined
into one picture again. Really, this is not much different than the way
many of the color
SSTV formats work.

Although the 1278 supports SSTV reception, all of the decoding logic is in
the
software external to the 1278. MFJ can send you technical information on
how
the 1278 sends the binary stream of data (the information is actually in
the
technical manual that comes with the 1278), but you'll have to figure out
how
each of the SSTV formats (Scottie1, Robot72c, etc.) is interpreted.

Jim

I found the same thing when I examined the docs as well. It appears that there must be some provision for sound boards as you have the ability to direct the output of the program to the speaker, serial port, parallel port, or serial device.

A friend of mine uses the logitec borard and has no problem in getting the program to run on that board. The problem appears to be the Sound blaster board only.

73 and thanks.

I HAVE BEEN RUNNING BAYCOM SOFTWARE FOR AWHILE NOW AND I LOVE IT.
I HAVE ADDED THE YAPP DRIVER AS WELL AS A 7PLUS ENCODER/DECODER.
YOU WILL NEED A BAYCOM MODEM TO CONNECT THIS TO YOUR RIG.
I RUN ONE THAT IS A KIT FROM A&A ENGINEERING.
THE BP-1 FROM TIGERTRONICS WORKS NOT TOO BAD EITHER BUT IT DRAWS IT'S
POWER FROM YOUR RS-232 PORT SO I PREFER THE A&A UNIT AS IT HAS IT'S OWN
POWER SUPPLY.IF YOU ARE INTERESTED IN MY MODIFIED VERSION OF BAYCOM,
JUST DROP ME A LINE AND I WILL SEE WHAT WE CAN DO.

From: <>
Message-ID: <2rlse1$d3q@hermes.fundp.ac.be>
Source record: 49082

Hello,

I try to use the NEWS facilities into TNOS so called NEWS Center.
Unfortunatly, I don't see any groups or like that when I connect the
NEWS Center. I suppose I must configure some files. Into the
autoexec.nos I start the NEWS, INFO and TUTOR server. At first, I try
to have a NEWS center with more than two choices. I give the names for
these facilities. But I only have two choices.
Into the directory NEWS or NNEWS, some files must be configured I
suppose.
Into the directories INFO and TUTOR it's probably the same.
Could someone help me to find the proper configurations to have
NEWSgroups.
Could someone help me to find or send me configurations files samples.

Best regards and many thanks.

Pascal.

1542. TNOS and NETROM.

From: <>
Message-ID: <2rlt7h$d9a@hermes.fundp.ac.be>
Source record: 49083

Hello,

I see there's no NETROM facilities into the TNOS compiled distribution.
I have some difficults to recompile the TNOS with BC 3.1.
I ask if someone includes the NETROM facilities into the TNOS and if
it's possible to send me the exe.

I test the TNOS on a 286 and sometimes the system hanged and stop.
I assume it's probably due to a lack of memory (only 2048 K) because
the
system stop when there are some connected features and only 12000 Bytes
free.

Could you help me to boost the memory process.

Many thanks.

Pascal.

> Newsgroups: rec.radio.amateur.digital.misc

A "typical" modem cable will not work correctly with HostMaster for the Macintosh. Most "High Speed" modem cables will work ok. Kantronics Host Mode uses hardware handshaking.

I've used a Radio Shack RS232 Jumper Box to convert Apple 1200 baud modem cables to work with HostMaster. I can give you the wiring diagram if you need it.

BTW, I wrote (and support) HostMaster for the Macintosh for Kantronics.

Hi there from Whitehorse!..

WE've got the spawnings of a really good IP network running here, but we have some questions about MSYS and FBB.. Specifically, MSYS appears to be serving our immediate needs for IP stuff, despite the apparent crudness of it's IP implementation, but it DOES work.. Anyhow, we've committed to staying with MSYS provided that compression can be provided for traffic on the HF side of things (a-la FBB), *or* if there is any way to interface an FBB system to IP traffic. We'd really like to know these answers, as it'll affect our data plan for the next several years...

Cheers,
Rich W.

Hello all! I have now been waiting for 7 weeks for my first
license to arrive in the mail. Having read all the horror stories
on the nets regarding waiting times, I decided to call the FCC in
Gettysburg and find out what the REAL problem is myself. I spoke
to a very nice woman who told me that it is now taking from 12 to
14 weeks to process application forms because there is only ONE PERSON
keying in the information to the computer. Also, she said that
the "new computer" that people have talked about on the nets is not
online yet. (Hmm...it only took me a couple of hours to set up my
latest 486 box!). At any rate, this ONE PERSON evidently has
thousands of licenses to process. The woman told me that she had
not heard of any offers from the ARRL regarding local volunteers in
the Gettysburg area coming in to help out with the backlog and
enter data into the computer. I told her that since we have
volunteers doing license testing, at no charge to the Federal
government via the VEC program, it seems that we could have
volunteer personnel to perform data entry! She also told me that
the Gettysburg office has requested additional help several times from the
Managing Director of the FCC in Washington, D.C., but the man
refuses to give them any more employees, for even a short period of
time, to clear up the backlog of license applications. I have
called my local Congressman, Representative Anthony Beilenson, and
told one of his staff about the problem. I asked if the
Congressman could contact the Managing Director and ask for some
additional staffing in Gettysburg, at least on a temporary basis,
to get the backlog of amateur radio applications (Form 610)
processed. Perhaps if everyone told their respective Congressman
about the problem, we could get some help! Here is the name,
address, and phone number of the FCC Managing Director who will not
let Gettysburg have any additional people to help get rid of the
backlog: Andrew Fishel
Managing Director
FCC
1919 M Street, N.W.
Washington, DC
(202) 632-6390
Just as an aside, I decided to get my amateur license because of
the problems associated with the January 17 earthquake here. The
American Red Cross had a severe shortage of qualified amateur radio
operators to handle emergency traffic after the earthquake. So, I
decided, as a citizen of the community, that I would get my
license, so that I might get involved in disaster communications,
and be ready to assist, if needed. But, as of right now, I can not
participate in any emergency networks until my license arrives!!

Also, I am routing a copy of the above information to President Clinton and Vice President Gore. I understand that Vice President Gore is very interested in information processing and bottlenecks in those areas of the government that are having problems processing data.

I am open to discussing this with anyone on the net, but if you want to work for the improvement of this problem, please call or write to Mr. Fishel and your elected federal government officials in Congress and The White House.
Sincerely,
Darryl Linkow (no callsign after 7 weeks and don't expect to see one for another 5 to 7 weeks!)

1548. [SUMMARY] PK-232MBX vs. MFJ-1278B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-22 08:35:25 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May22013525@hobbes.vigra.com>
Source record: 49087
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I got a lot of helpful replies to my recent "PK-232MBX vs. MFJ-1278B" post. Thanks much! Here's what I learned:

Most people strongly prefer AEA's gear over MFJ. Apparently, MFJ's quality control leaves something to be desired. Some have had better luck than others, but some replies indicate that MFJ does much poorer with weak signal HF, and the MFJ leaks significant amounts of RF, which hurts some more than others. The filtering on the PK-232 is much better than the MFJ's, and the tuning indicator is more useful.

Both units are about equal for local VHF packet, where filtering and discrimination isn't too much of an issue. Many recommended checking into the KAM units or PK900 as well, but I haven't yet.

ROM upgrades for the PK-232 are more expensive ($75 + $25 for docs) than the MFJ upgrades ($25). If you plan on upgrading often, this may be an issue.

It's true that only the MFJ does SSTV and shaded Fax, so for those who use it for that, the AEA can't substitute. However, most replies recommended getting a basic Fax-only box if Fax is going to be a significant factor. The AEA-FAX (~$100 hardware & software) is well recommended.

Apparently, AEA doesn't provide or make available any software to decode the Fax data from the PK-232, making it pretty useless. MFJ is a better about it, but doesn't get along with Windows very well. The MFJ software may also be minimally copy-protected, which seems odd.

The internal BBS feature on the MFJ (pbbs) seems a bit better than the PK-232's (PakMail). People like the CHAT command and some auto-forwarding features. It sounds like gobs of RAM aren't really an issue for personal mailboxes with medium traffic.

Overall, it sounds like the PK-232 is a much more reliable unit for Packet and other modes, but if SSTV or Fax are critical, MFJ or specialized boxes are the only option. Many suggested starting with the inexpensive Baycom (~$50), but it only work's on DOS machines.

Thanks very much for all your responses! Especially these helpful folks:

Source record: 48993

My compliments to Kantronics.

I recently (Dayton) purchased a KPC-3 TNC and decided to det the memory and clock upgrades. I called Kantronics and asked to order some parts. Unfortunately No one was available to handle my order. The person apologized and advised that she was just the receptionist and didn't know if she could be of much help, But she had access to their parts lists, took my order, advised me of the total, and three days later the parts arrived! Not bad for "just the receptionist"

BTW the KPC-3 is GREAT little TNC for the money.

.
Sorry Darryl! I waited 11 weeks, 4 days for mine. After 10 weeks I
made the same call that you did to the FCC. It is WORSE than you explained
it seems that the little old lady only enters the data on Tuesdays, proofs
on Thursdays, and mails on Fridays. I used my handy dandy FAX modem to
five Senators and 5 US Reps. I got better response by using FAX (and it is
cheaper than USSnail). I lucked out - Sen. Feingold's aide, Darrin Schroeder
called the FCC the NEXT day. Funny thing happened - my license is dated
the VERY DAY of his call.
.
There is a nasty rumor - which, of course I can't give credence to <g>, that
the FCC is using US hams to put pressure on Congress to give them more
staff (which, of course would be put to "better" use than in the amateur
licensing section :-( ).
.

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/packet/
aprs501a.zip Hams: Automatic Packet Reporting System (APRS)

APRS provides real-time display of operational traffic via UI frame broadcasts and map displays. A station with information to contribute transmits, and all stations on frequency receive and display it.

The most significant change in aprs501a is the elimination of at least 40 CTRL/ALT key commands by placing most functions into sub-menus. A number of other improvements and bug fixes are included.

aprs501a.zip is the latest version (as of 13 May 94) of APRS, and contains all files. It has replaced aprs405a.zip and aprs403x.zip.

>packet is going on (as it does with the pc speaker), then perhaps I'm
>wrong and it's worth a try.

I experimented with a similar project; I wrote a driver which speeds up the system clock and samples one of those AEA fax interface units, to try to get HF fax running under Linux. I found that the IDE disk driver (at least for Linux 0.99.10 or so) disabled interrupts for long enough to skew my picture by 5-10% of the width each time a sync() occured :-(

I did not notice any other delays besides the IDE disk. I now have a SCSI-based system and it may not exhibit this problem. I also heard that the Linux IDE driver has been improved lately and does not disable interrupts for as long as it used to.

Bottom line is, you must use the timer interrupt for polling as it is the highest priority; and also you had better have as good (or better) an understanding of the behavior of every driver, wrt locking out interrupts, as the people who wrote them. It's probably safest to determine this empirically, by cranking up the tick speed and counting the ticks for a few hours. Beat on the system as hard as you can during this time, and see if you missed any ticks (by checking against a real clock). You should be able to nail down the maximum tick rate permissible and then decide if this is fast enough sampling for your application.

Source record: 48999

I have posted this before about 1 week ago, but it did not appear to get anywhere so please forgive me if you are reading it twice.
Anyway the main point is does anyone anywhere know of any software for the apple 2 that allows it to run packet WITHOUT the use of a Super Serial Card as the are pretty hard to come by. The apple has a perfectly good Game I/O connector and I do not see why it could not be implemented to use a modem such as Baycom. I am seriously considering writing my own software if I do not find some, and I am also considering writing similar program for the Spectrum with an Interface 1 to use its' serial port and microdrives. Perfectly suited computers if you ask me, the C64 has it why can't the speccy or the Apple.

Anyway what do I know I'm only a first year university student !

Seriously though anyone with any information please contact me all replies greatlfully recieved..

Thanks in advance ....

From: psaffren@cruzio.com
Message-ID: <Cq9p12.K0@cruzio.com>
Source record: 49002

I bought a knight dmm kit at a local swap meet and it's missing the instructions to put it together. Unfortunately I don't have the model # at hand but it's a small orange dmm capable of freq, capacitance measurements as well as the regular volt, ohm, current. The docs would be great, but a phone #/address for knight or its distributor would suffice.

tnx

I don't think the original post was by a ham.

Anyway, once you go digital, there are all sorts of ways to scramble.
It was not clear to me exactly what the poster wanted. Books on
how to do a simple DtoA and AtoD conversion? Books on introductory
cryptography?? How to apply a digital bit-stream to an NFM modulator?
What do you want??

As I understand Part 97, it is illegal to encrypt on the amateur
bands if the intent is to hide or obscure the content of the
information. What if one's intent is just to "study" cryptography
as applied to RF communication? ;-))

Another arm-chair lawyer heard from.

The request was for scrambling information, not for how to scramble
an amateur band radio.

The people you want to talk to ar MX-Com. They make a wide variety of
scrambler chips both in simple voice band inversion and multiple-band
voice inversion with band hopping. 1 800 638 5577

Most of the "secure" cordless phones now are using the same inverted
voiceband scrambler chip. I added one to my PRO-2021 scanner and can
invoke "insecure" at a flip of a switch.

Let's save to can't do and cries of foul play for when it is deserved.

To the best of my knowledge there ain't none. (Explains the shortage!)

What you want to do is find "Poor Man's Packet" I believe it was released with the source code. (The source was available when it was first released via 73 magazine).

The source code (and a hardware reference manual) will show you how it's done.

I just started using a Windows based program called Paint Shop Pro.
It reads .GIF,.JPG,.BMP,.RLE,.TIF & more. It also converts between
them and has a nice bevy of tools for modifying color, size, etc.
I think the file name is PSxxx.ZIP or something. It should be on
ftp.cica.indiana.edu or try Archie.

If you are using a 9-to-25 pin data line adapter, use an ohm meter to determine if all pins are fed through that adapter. I had the same problem as you and found that a number of my adapters did not feed all the pins through. Once I found a 9-to-25 that worked (from my Logitech mouse), all was well.

An good way to make the baycom modem "hear" more anmd if you also suffer from a lot of rejects being sent and recieved, is to link the unused gate input in the 74HC14 chips input to ground. This makes the modem more stable. Also have you set up the recieve pot, as it does not necessarily have to be 2.7V fiddle and see. I use a baycom modem, with baycom, Gp, and Sp6 and it hears signals that don't lift the needle. Baycom program itself is not the greatest hearer, try SP6 with Tfpcx V1.10 or above (GP V1.161). Only snag is u need an EGA display or above. SP6 is very ike baycom, and if you a want a copy I'm sure I can arrang it. A lot more versatlie though.

1576. TNOS and NETROM help needed.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-24 15:31:22 UTC
From: <>
Message-ID: <2rt6ka$8i8@hermes.fundp.ac.be>
Source record: 49018

Hello,

I see there's no NETROM facilities into the TNOS compiled distribution.
I have some difficults to recompile the TNOS with BC 3.1.
I ask if someone includes the NETROM facilities into the TNOS and if
it's possible to send me the exe.

I test the TNOS on a 286 and sometimes the system hanged and stop.
I assume it's probably due to a lack of memory (only 2048 K) because
the
system stop when there are some connected features and only 12000 Bytes
free.

Could you help me to boost the memory process.

Many thanks.

Pascal.

1577. TNOS and NEWS Center help needed.

: Thanks in Advance
: Chuck McMahan

I am not aware of share/free ware to do this but I know that any comm program can access the paging terminal. Ask the paging co for the terminal access number, just dial it as you would a BBS, etc., but in my experience the paging co's usually use 300 or 1200 bps. It will then ask for "ID=" and this is usually just the name of the paging co (e.g. MCCAW), then give the telephone no. of the pager (no area code seems to necessary) and then the message Works great for occasional use although for heavy use a dedicated program would be preferable.

steve.diggs@totrbbs.atl.ga.us (Steve Diggs) writes:
>We're getting the cart before the horse in this message thread. 9600
>packet is an IF interface; squelch control is a AF section function.

Not at all. 9600 bps as used by the K9NG et al modems is simply direct FSK; it appears at the FM radio's detector as audio with a maximum component at 4800 Hz. I suspect you mean 'detector' instead of 'IF'.

>audio at the IF is always unsquelched, and rightly so.

Yes, you'll need unsquelched audio for the demodulator in the modem. On most radios, you can pick this off the output of the detector chip. With Motorola Mitrek and Micor radios, the buffered (not NOT deemphasized) audio available on the control connector on the front of the radio works just fine!

>Further,
><anything> do to with the AF section screws 9600 transmissions up due to
>the normal pre-emphasis and de-emphasis curcuitry in the AF section.

Yes, the normal audio path for the transmitter isn't going to pass the 4800 Hz audio that is the digital signal. You need to go directly into the modulator. In the Mitrek, you can do this by shoving the modem output audio directly into the channel element - you just cut out one resistor (R515?) to isolate the channel element (which contains the modulator) and insert the audio there. There are spare pins on the control connector you can use to get the signal into the radio without having to drill any holes.

>seems that 9600 packet audio requires it's own custom de-emphasis based
>on the exact discriminator used in order to get the eye pattern right to
>the modem. Hence the difficulty of getting the IF interface right.

If you wish to be extreme, perhaps. I find that I get quite nice eye patterns by simply keeping the transmit deviation down around 2 to 2.5 kHz max so that I don't rub against the edges of the receiver IF.

>So...bottom line is...doesn't matter how fast/slow the squelch
>is...you're way on the IF side of the squelch curcuit anyway.

But that's not the point. If you are building a repeater, it is not really a bad design to use the radio's SQUELCH to control the transmitter PTT and timers. You can easily speed up the squelch - just make a few of the timing capacitors in the squelch circuit a bit smaller or remove them entirely - and the radio will key up faster than the current modem's carrier detect circuit can operate.

There is one caveat here: most squelch circuits work by using a high-pass filter to measure noise from the detector and use that to decide when a signal is quieting the receiver. You have to make sure that your squelch circuit's high-pass filter is listening well above the 4800 Hz of the 9600 bps signal, which may mean making some caps a bit smaller here and there.

>I clearly state here that this is an area for ongoing discussions, as I
>am not satisfied with the work I've done so far in 9600 packet, so any
>help/comments/objections is appreciated.

I have one point I've not yet decided upon: what to transmit during the repeater's delayed-drop ("hang") time. There isn't a simple universal answer, I suspect.

If users use K9NG modems for the repeater client stations, I have to transmit random noise during the DDO, because otherwise the user modems will detect carrier and will hold off transmissions until the repeater carrier drops. If I am using one of the better modems (G3RUH, TAPR-new) in the repeater's repeat circuits, they will NOT retransmit noise in the absence of carrier.

The best solution I've come up with was to simply have a ZERO DDO - in other words, no hang time at all. Since the repeater is a modified Mitrek, there are no moving parts, and I really can do this, at the sacrifice of some keyup delay. The trick there is to keep the TX channel element powered continuously, so that it doesn't take any time to start. The Mitrek has some power sequencing circuitry in it to ensure that the transmitter doesn't produce power until after the antenna relay has changed over; I'll have to bypass that too.

I'm still fiddling too, and I'm interested in others experiences as well.

1580. UK TCP/IP meeting - announce

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-24 17:59:45 UTC
From: eeyimkn@unicorn.nott.ac.uk
Message-ID: <2rtfah$epn@unicorn.ccc.nottingham.ac.uk>
Source record: 49099
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

Hi folks,
As promised a few days ago, here's the official (ahem) announcement for the forthcoming UK TCP/IP AMPR network meeting. An occasion not to be missed...

TCP/IP Network Meeting
R:940516/0722z @:G7GPA.GB7BAD.#23.GBR.EU [The AmprNIC]

;;;Emacs-fodder: -*-Text-*-

Greetings, TCP/IP-people,
After the success (even though I managed to erase the minutes) of last year's Region 4 TCP/IP meeting, it gives me pleasure to announce:

The Second U.K. TCP/IP-AMPR Network Meeting

Date: Saturday, 18th June 1994 Venue: Nottingham University
Cost: Free Open to: Anybody
(note - date is provisional, but will only change if there's a _very_ good reason, i.e. NFD, World War III :))

This meeting is being held as a forum to discuss new ideas in TCP/IP networking by radio, and to help develop a plan for developing the network and increasing connectivity to produce a working plan. Other possible topics for discussion include - software, networking under alternative systems (Linux!) and anything else that's of interest.
I've called this meeting 'UK' as last year's meeting covered more than merely Region 4 specific issues, and also because I think it would be a great idea for us all to get together for a talk and a few beers, to hopefully produce a little more cooperation between different parts of the country, which would be universally beneficial.

A few suggested topics for discussion:
- Domain naming conventions (and problems with name service)
- Mail delivery over the wide-area UK network
- Distribution of network news
- Addressing schemes (we need to sort this one out! ;-))
- Networking with Linux (and other Unix versions)
- Interchange of mail and news with the Internet at large
- Interfacing with the vanilla AX25 network, and development of a common carrier?
- Trends in TCP/IP networking as seen on the Internet (Gopher, WAIS, WWW, high-speed networking)
- The legal issues raised by the above (sigh..)

Anybody who wishes to add something to the agenda (the above are only suggestions), please get in touch with me (addresses at the end).

If anybody would like to attend (which I hope you will!), then also drop me a line so I can get a rough idea of numbers and work out which room I need to book.

Please put 'TCP/IP Meet' or similiar in mail subject lines so I know where to file it. Thanks..

73
Mike G7GPA

Actually, many of the SCSI adapters, such as the 1542 from Adaptec, are
BUS MASTER devices. This means that the main CPU cannot get on the bus
to service interrupts at all during some periods. Bus mastering is a
desirable way to improve performance for DMA on disk controllers. Expect
to see lots more bust mastering on the newer bus achitectures.

Bottom line is, a PC's main processor makes a terrible SCC controller.
the BAYCOM and PMP approaches are neat little hacks that really can
only work when you're talking about a DOS based machine that can run
without any preemption. Windows, Unix, Linux, OS/2, and most operating

systems have preemptive scheduling. Sure you can tweak them to handle the timing needed for a $50 BAYCOM modem, though you run the risk of having to spend considerably more on enough computer horsepower to hit the timing windows, and enough of your time to make it non-cost effective.

What I find odd, is that spending another $50 to get to $100 and buy a real TNC, that can handle the synchronous communications of the packets on the air, handle the HDLC framing, etc. is MUCH simpler than trying to hack a multi-threaded or multi-processing OS into being able to handle a BAYCOM modem. Sometimes the hardware solution is cheaper...

Hi there,

I dont know if this is the correct list for ask about the subject. Pse, forgive me if so.
I've a f6fbb+bpq BBS running and a modem port with a Zoltrix 14400 modem. The last one would be better used if a full LL BBS were activated there. I guess a software like Quickbbs or RemoteAccess as a good deal. However, for hams, the fbb would be lost thru its phone access. So, I'm curious about:

- Is there a way to get linked fbb and Quickbbs or RemoteAccess (of course, the modem would out of fbb control) ? For instance, the privilege on LL BBS would be set to hams in such way they could "go" to fbb and vice-versa. Sounds like a crazy idea?

- if the above configuration is not appropriated to the idea, what set up could I do to joins both "things"? Some time ago, I saw some headers in the radio bbs traffic with the word "PHONE", below or above another "true" line, both with the same callsign. I guess that was made automatically.

Can someone help me?
Many thanks in advance es 73's
ps: if this list is the wrong place, please, email me directly.

Dick Hale (dick.hale@woodybbs.com) wrote:
: Can you tell me if the TEKK Radios have an audio modulator.. or only
: a shift line for data ?
:
The TEKK "micro" radios have a linear transmitter input with no deviation or bandwidth limiting or shaping. Your signal is coupled directly to the modulator. The receive signal comes right from the demodulator chip with no shaping. I didn't look right before I wrote this, but there are probably coupling capacitors used in both lines, limiting the ultimate low freqency response, but it passes the K9NG/G3RUH TX signals with very good fidelity.

The TEKK "mini" radio has deviation limiting, high and low pass filters in the TX path, and high frequency roll-off (3 kHz?) in the receive path. The TX signal is probably good enough (better than most radios who's PLL is modulated) for 9600, but the receiver needs to have the low-pass filter modified or bypassed - otherwise there is too little high-frequency component and a strange looking eye pattern.

Source record: 49028

I'm suprised John didn't mention it - the new TAPR NETSIG mailing list is heavily involved in discussing 9600 (and faster) modem/radio issues.

Quick comment: Regarding copying beacons, and being able to connect, but not move much data, you could be seeing two things:

1) Your radio TX to RX switching time is cutting off the other station's header, giving your modem inadequate time to syncronize on the incoming data stream, or
2) You're seeing the result of a high bit-error rate.

I favor the latter, because you imply that you don't usually get connected on the first attempt - 1 or 2 retries required. The longer the packet, the higher chance of an error. A connect packet (bare AX25) is less than 20 bytes (less than 160 bits), not including pre-frame flags. A packet with 256 bytes is over 2200 bits. If you are having trouble getting less than 160 bits through error-free, you are going to have almost 14 times more trouble getting 2200 bits through without an error.

Also, as a side note, when we've done testing here on link reliability we usually are using the 'ping' feature of tcp/ip and NOS to do the testing. We run 'datagram' (unconnected) mode and usually use 200-400 byte packets. I have noticed that with two analog modems (TAPR on one end, PK-900/PK-96/TAPR/G3RUH on the other) that the best ping response I can get is about 95% through our TAPR bit-regen modem equipped 2M repeater. This is over about a 45 mile line-of-site path. Switching to a DSP-2232 will improve the ping return rate to about 98-99%. Kudoes to N4HY. Note that due to atmospherics (ducting, etc) and the fact that the repeater is at about 5000 feet we have times when the path to the repeater is poor to unusable, too. This is part of why our next generation of repeaters are at low altitude sites, mostly cell sites.

: "All the science I don't understand, It's just my job five days a week"

Hi Stuart,

The info is pretty generic, because unless your TR-7400 has been modified, that connector info really does apply to all Kenwood transceivers using that connector. When I was with AEA I was responsible for gathering and verifying all the radio connection info, and Kenwood was kind enough to confirm it. You could probably use the TT pad input, but with no PTT connection it probably isn't very useful. Also, that radio tends to have very poor audio characteristics for packet, primarily too much de-emphasis, as I recall. 7400's I can remember listening to roll off the high-frequency audio on receive for packet more than most TNC's can compensate for. If you have schematics you might be able to locate capacitors that can be removed or replaced with lower values to correct this.

From: wb6w@netcom.com
Message-ID: <wb6wCqBzK1.BKE@netcom.com>
Source record: 49092

Another issue that is of some criticality to 9600 ops is frequency netting. Most of the amateur FM radios I've looked at have carrier frequencies on the order of a few hundred Hz. My own 9600 radio is a multi-mode, so I can tune in 100Hz steps - something the usual FM radio can't easily do.

By experimenting with some of the locals, we found that a 200 Hz error between TX & RX (100Hz each) will blow the channel reliability to kingdom come. A 400Hz error will render the channel unusable.

It is not very difficult to "net" most synthesised or xtal radios,

...*BUT*...

you have to know to do it. (I haven't seen this particlar kink mentioned very often on here - so here it is again!) 73 de Glenn wb6w@netcom.com

1594. Straight Key Interface for Supermorse

I'll have to draw up the circuit used in the D4-10 (based on the '3362 IC) --
it's very fast, and listens high enough that it works fine on 19.2 data (ie,
maximum 9600 Hz components).

>The best solution I've come up with was to simply have a ZERO DDO - in

>The Mitrek has some power sequencing circuitry in it to ensure that the
>transmitter doesn't produce power until after the antenna relay has
>changed over; I'll have to bypass that too.

We've been running our 19.2 repeater with 0 hangtime and it works very well.
At the moment, the repeater is built out of a pair of D4-10 radios (I want to
replace at least the transmitter with a modified commercial unit ASAP, both
to get some more output power, and to free up a $350 radio for other uses).
The receiver squelch drives transmit PTT through some minimal control and
timeout circuitry. There's no delay built into the system at all.

Actually, this method of operation is necessary for us, since we're using
squelch-derived DCD on all the radios in the system -- a hangtime would render
the network useless.

Anyway, the delays introduced by running the repeater this way are pretty
minimal. On the test bench, two of the D4-10s can talk to each other directly
with a TXDelay of about 8 to 10 milliseconds (using the Ottawa PI card, which
has 1ms timer resolution). Through the repeater, a TXDelay of 20ms works
fine, so the added delay is pretty minimal.

In the real world, we work through the repeater with a TXDelay of 50ms,
because some of the stations that are driving KISS TNCs with G8BPQ seem to
have problems with shorter delays -- I don't know why.

Source record: 49036

Baycom will work with very low signals if it is set up right. The
software isn't the best, and I recommend that you get your hands on Sp6,
Graphic Packet, or Mubay.
Anyway to make the modem a lot less deaf, link pins 11 to 7 on the
7414 Ic. This connects an used inpput of an inverter to ground, as should
be the case on all 74 series ICs.
I found this to severly improve reception of low signals and it also
cuts down on rejects sent and recieved.
Also have you setup the recieve potentiometer properly, 2.7 V is not
always the optimim value.
Fiddle with it in graduall steps and see. But do link those pins.

Way I have my TNC hooked to my Mac is thisaway...I use a high-speed modem
cable from my Mac to a switch box (8-pin DIN -> EIA-232 connector) and
from there have two EIA-232 cables going out, one to my Modem and one to
my TNC. Be warned, though...use SHIELDED cables all the way through.

Some time ago, a fellow posted that he had received the Creative Labs SoundBlaster ASP developer's kit, and was going to undertake writing a packet TNC in software, using the sound card hardware.

I can't find the original message, but am quite interested in the status of this project.

In addition, I'm interested in work to make a PC with sound card into a nice simplex repeater controller. The possibility of linking two such systems via the Internet is interesting.

1603. Packet radio inquiry

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-25 17:40:24 UTC
From: verdant@twain.ucs.umass.edu
Message-ID: <2s02i8$b1k@nic.umass.edu>
Source record: 49094
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hello,

My organization will be buying some telecommunications soon, and one of
the options we would like to examine is setting up a packet radio link.

Here is the situation: Our campus operates on a digital phone system,
and the people who run the digital phones are very stingy about giving
out analog lines. We would like to have an analog line to set up a fax
modem. Barring this we would have to spend about $350 extra to get
something called a Terminal Adaptor Unit installed, and that would give us
9600 BAUD connection to the local computer network on a separate data line,
but no fax capability. (Not to mention the phone itself costs around $200)

The idea occurred to us to use a packet radio to link to a volunteered
data-line. They undergrads are given free digital datalines in the dorms,
and we may have a member off campus, even better, willing to install an
analog line and set up our computer's fax modem there. This would be
cheaper and preferable. We may even be interested in a second radio
which would send/receive voice calls on an off-campus phone, but we would
probably like to scramble the signal.

Any suggestions? Assume we will not be able to put up an outdoor antenna(sp?)
Also, we would like something more or less pre-packaged and simple. Assume
a budget of $300 for the packet radio and $200 for the voice radio. I am
clueless as to how much these things generally cost.

Thanks for any help.

Brian

1604. 9600 baud observations...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-25 18:14:25 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <79731@uugate.wa7slg.ampr.org>
Source record: 49130

We are in the process of putting 9600 baud links online here in Utah
(as well as 56kbaud and 1.5 Mbaud) and I had the pleasure of hacking at
some radios and TNC's, trying to make them work at 9600 baud.

UUGATE (the University of Utah Amateur Radio Club Gateway) uses a MoCom 35
for its 9600 baud port. Originally, this radio was incredibly awful for
9600 baud use owing to its non-flat and narrow IF responses (approx 11 KHz
wide with >8db ripple) and its receiver had to be modified extensively. I
wrote about this a month or two ago. Once modified, it now works extremely
well, having an 18KHz wide bandpass and being very forgiving to off-frequency
transmitters. Something at 3 KHz deviation 2 KHz off frequency isn't a problem.
Its TX>RX recovery is about 5ms average and its RX>TX time is about 12ms.

The local entity working to improve the local network acquired a lot of GE
Mastr Exec II's (same guts as MVP's, etc, mostly). These were standard
low-split (406-420 MHz) radios (just what we needed since our link and user
frequencies are in the 420-431 MHz range...) Again, the receivers in these
radios were incredibly awful. They were 11 KHz wide or so and refused to
go wider. We ended up removing 2 of the xtal filters in the IF and reshuffling
the remaining two. This yielded a radio that works well, but is unuseable
if you have to worry about adjacent channels. Not a problem for us, since
the packet is very far from any adjacent channels. As long as there isn't
any very strong adjacent-adjacent channels, these will work fine. Also, som
e simple TX modification was done to allow modulation, as well as some removal
of some capacitors in the sequencing circuits to speed TX<>RX turnaround. Oh,
that capacitor on the wiper of the RX audio pot on the discriminator need to be
increased to at least 4.7uf, OR ELSE!!! I'd be happy to post what exactly
was done.

One final note about the GE's: If yours are like ours, if you plan to use
them as a repeater where there are likely close adjacent channels, I'd simply
re-do the current IF (11.2 MHz) using 16-18 KHz wide 2-pole 10.7 MHz xtal filter
s, remembering to order the receive xtal appropriately. Again, as they came,
they were AWFUL!!!

Concerning the 9600 baud modem DCD's, its been my observation that some
TNC firmware will happily ignore the DCD as far as receiving packets goes.
You can copy all of the packets you want with NO DCD indication at all. I
had a version of firmware years ago that was this way (I discovered this by
accident when testing the TNC in an analog loopback configuration) Whether
or not the current crop of TNC firmwares is this way or not, I don't know.
The DCD *is* observed on HDX transmit, though... I'm not sure how/if this
applies to the 9k6 modems...

I'd like some comment on the TAPR and (apparently) MFJ firmware KISS modes.
With both, I've observed that after some time (5-10 minutes, maybe) the TNC

seems to reset, losing current timing parameters like TXDELAY, SLOTTIME, etc. This is REALLY annoying at 9600 baud, since the default parameters are 1200 baud-oriented... Any comments?

As for 9600 baud repeaters, the TAPR 9600 baud modem's regenerative repeater kit is recommended. It actually has a propagation delay in it, owing to a elastic FIFO. That is, if you were to key the repeater the instant a signal was heard, there is still time before the received bits come back out the other side (FIFO, descrambler/scrambler, etc.)

One final note: Remember that if you are running KISS to a TNC, your TXDELAY is not as simple as it may seem. Remember that when a packet is to be transmitted, it must be KISSed from the computer to the TNC. If you wer xxx are running 9600 baud KISS to a 9600 baud TNC (and I would STRONGLY recommend that you DON'T!!! Go to at LEAST 19200 baud for the KISS baud rate!!!) it takes at least as long to send the packet to the TNC as it does for it to be sent over the air. Most of the time, that extra delay must be considered in part of the overall TXDELAY. Thus, if you were running, say, a 70ms TXDELAY, and the radio at the other end had a turnaround of about 100ms (which seems to be about what the unmodifed Yaesu FT-736 has...) since it takes 100 or so ms to KISS the packet the the TNC, everything is fine. However, if you were to run something that did NOT KISS the TNC (i.e. in native AX.25, a PI2 card, or a P10 or DataEngine) then you have a TRUE 70ms TXDELAY and the exchange fails to work, noteably in the ACK-next packet sent exchange. This exact thing happend to a local user, so beware...

1605. Motorola GPS engine purchase information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-25 18:20:41 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <243_9405281911@idn.nl>

From: bonomo@specxn.enet.dec.com ()
Organization: Digital Equipment Corporation
Date: Wed, 25 May 1994 18:20:41 GMT

Greetings, one and all!

This message is ASCII text, formatted as <CR> at =<78 characters, tabs at +8.

Have finally received "everything" which I will obtain from Motorola and Trimble, and the order requests have dwindled to a minimum, I have attached the specifications and pricing below.

In a nutshell, the Motorola unit is better in every way, excepting three factors. The Trimble unit:

1) is about 1/8" smaller in width and height,
2) is about .6 ounce lighter,
3) consumes less power in standby, quoted as ~2uA nominal, versus the Motorola's stated maximum of 60uA.

Other than that, the Motorola VP Oncore engine is superior in all ways, including price. The recommendation, from my perspective, is to choose the Motorola unit, but your choice may vary. The above factors, in which the Trimble unit is superior, may be significant ones for you.

I have had requests from 375 individuals, from nine countries, for over 435 units. All this is, of course, based on a "$150" purchase price, which is not available.

Understanding this, it seems best if there is a "standard" configuration which is ordered, as the pricing given is for quantities of 100 and greater. If 100+ want the options, we'll order those, too. Remember, all prices are for 100+ units per item. In other words, if 25 units are wanted with the LNA option, the pricing for that LNA option will be be somewhat higher than the figure quoted below, and I'm not sure if Motorola can (or will) handle one-sie, two-sies and get it right.

****
The recommended "standard" configuration:

Item Price / each (includes Colorado State sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22

Total "standard" $360

****

Options to be considered:

LNA $ 16
battery $ 11

Shipping within the continental U.S., via 2nd day service, will run $10. This includes a box, packing foam and shipping charges. This figure is good for up to ten units.

Those interested in this group purchase should remit monies to the name and address below. Please send non-cash such as personal checks, money orders or the like, as it allows records to be kept much more easily. If less than 100 orders are placed, the checks/money orders will be destroyed, rather than incurring the cost of returning up to 100 of them. Alternately, if you want your check returned in the event of an insufficient number of units ordered, add a dollar bill to cover the cost of an envelope, stamp and my or my wife's writer's cramp which will inevitably result. If the order threshold is reached and an order is placed with Motorola, the $1 will be returned to you with your order. Please include a very complete address to which the order may be sent. Include your current Internet address and telephone number(s) where you may be reached, as well. I've experienced several Inet addresses which have bounced, by the way, so if you didn't receive a response from me directly, it was attempted.

Send orders to:

Thomas A. Bonomo
8147D Summerset Drive
Colorado Springs, Co. 80920.6123

I can be reached, and have been by several individuals, at:

Telephone: (719)593.9883 Home (evenings, weekends)
(719)592.5105 Office (weekdays)
Internet: tom.bonomo@cxo.mts.dec.com

This message will be posted to the newsgroups, as well.

Thanks for your patience as I've gathered information and responded to each of your requests.

Regards,

Tommy

Specifications and pricing information follows.

Motorola VP ONCORE SPECIFICATION DATA SHEET

Receiver Architecture
---
o 6 channel
o L1 1575.42 MHz
o C/A code (1.023 Mhz chip rate)
o Code plus carrier tracking (carrier aided tracking)

Tracking Capability
---
o 6 satellite vehicles simultaneously

Dynamics
---
o Velocity: 1000 m/s when altitude less than 18 km
o Altitude: 18 km for velocities greater than 514 m/s
o Accelleration: 4 g

Antenna
---
o accepts active and passive antennas

Acquisition Time

(TTFF = Time To First Fix)
o 22 sec. typical TTFF (with current almanac, position, time and ephemeris)
o 48 sec. typical TTFF (with current almanac, position and time)
o 2.5 seconds typical re-acquire

Accuracy
---
o Position: less than 25 meters, SEP (without SA).
DoD may invoke Selective Availability (SA), potentially degrading accuracy to 100 meters (2 dRMS)

DATUMs
---
o 49 std. datums, 2 user defined, default WGS-84

Signal Level
---
o TTL

Output Messages
---
o Latitude, longitude, height, velocity, heading, satellite tracking status (Motorola Binary Protocol)
o NMEA-0183 Version 2.00 (GGA, RMC, GLL, GSA)
o LORAN emulation mode
o Software selectable

Operating voltage
---
o 4.75 - 5.25 VDC, 50 mVp-p ripple

Operating current
----
o 230 mA typical @5V, 275 mA max at 5.25V

Standby voltage
----
o 2.5 - 5.0 VDC

Standby current
----
o 60 ua max

Dimensions
----
o 2.00" x 3.25" x .64" (50.80mm x 82.55mm x 16.26mm)

Weight
------
o 1.9 oz. (53.9g)

Connectors
----
o Digital: 10 pin (2 x 5) header on .100" centers
o RF: right angle OSX (sub-miniature snap-on)

Operating Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Storage Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Humidity
----
o 95% RH, non-condensing

Vibration
----
o 7.7 g, random (survivability)

MTBF
----
o >61,000 hours (estimated)

Optional features
----
o Lithium battery
o Low Noise Amplifier
o Real Time Clock

Pricing (includes Colorado state sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22
Low Noise Amp $ 16
Lithium Battery $ 11

Development Software
1st option $270
includes:
Raw code phase,
disc data,
smooth sat time,
carrier phase

2nd option $215
includes:
above without
carrier phase

Specifications for Trimble SVeeSix GPS engine

Model: SVeeSix-CM2

General

L1 Frequency, C/A code (SPS), 6 channel, continuous tracking receiver

Update Rate

NMEA - 1Hz

Accuracy

Position: 25m without SA
Velocity: 0.1m/s without SA
Time: 1 us (nom)

DGPS Accuracy

Position: 2m to 5m (2 sigma)
Velocity: 0.1m/s
Time: 1 us (nom)

Acquisition (typ)

Cold Start: 2 to 5 minutes
Warm Start: 50 sec with time upload
Hot start: 30 sec with time upload

Reaquisition

<2 sec

Dynamics

Velocity: 500 m/sec max
Acceleration: 4g
Jerk: 20m/sec^3

Environmental Specs.

Operating temp: -10C to +60C
Storage temp: -55C to +100C
Vibration: 0.008g^2/Hz 5Hz to 20Hz
0.05g^2/Hz 20Hz to 100Hz
-3dB/octave 100Hz to 900Hz

Operating Humidity: 5% to 95% RH non-condensing @+60C
Altitude: -400m to +18000m

Physical Characteristics

Dimensions: 3.25" x 1.83" x 0.58"
Weight: 1.3 oz. (36.4g)
Connectors: RF: SMB, I/O: 8 pin (2x4), 2mm header

Technical Specifications

Prime power: +5Vdc (-3% to +5%)
Power consumption: 280 ma, 1.40 watts
Backup power: +3 to +5 Vdc
Backup consumption: 1 uA @3V and +25C (nom)
Serial port/1PPS: CMOS TTL
Protocol options: TSIP @9600 baud, 8-O-1
NMEA 0183 v2.0 @4800 baud, 8-N-1
TAIP @4800 baud, 8-N-1

NMEA messages: Standard: GGA,VTG
Optional: GGA,GLL,VTG,ZDA,GSA,GSV,RMC

Pricing (includes Colorado state tax)

SVeeSix CM2, DGPS capable $321
Antenna (includes cable) $118

Specifications for Trimble SVeeSix GPS engine

Model: SVeeSix-CM2

General

L1 Frequency, C/A code (SPS), 6 channel, continuous tracking receiver

Update Rate

NMEA - 1Hz

Accuracy

Position: 25m without SA
Velocity: 0.1m/s without SA
Time: 1 us (nom)

DGPS Accuracy

Position: 2m to 5m (2 sigma)
Velocity: 0.1m/s
Time: 1 us (nom)

Acquisition (typ)

Cold Start: 2 to 5 minutes
Warm Start: 50 sec with time upload
Hot start: 30 sec with time upload

Reaquisition

<2 sec

Dynamics

Velocity: 500 m/sec max
Acceleration: 4g
Jerk: 20m/sec^3

Environmental Specs.

Operating temp: -10C to +60C
Storage temp: -55C to +100C
Vibration: 0.008g^2/Hz 5Hz to 20Hz
0.05g^2/Hz 20Hz to 100Hz
-3dB/octave 100Hz to 900Hz

Operating Humidity: 5% to 95% RH non-condensing @+60C
Altitude: -400m to +18000m

Physical Characteristics

Dimensions: 3.25" x 1.83" x 0.58"
Weight: 1.3 oz. (36.4g)
Connectors: RF: SMB, I/O: 8 pin (2x4), 2mm header

Technical Specifications

Prime power: +5Vdc (-3% to +5%)
Power consumption: 280 ma, 1.40 watts
Backup power: +3 to +5 Vdc
Backup consumption: 1 uA @3V and +25C (nom)
Serial port/1PPS: CMOS TTL
Protocol options: TSIP @9600 baud, 8-O-1
NMEA 0183 v2.0 @4800 baud, 8-N-1

Hi folks,

Louis A. Destree (N7XNX) wrote in the Issue 160

>> I will not be writing any follow-ups to this post, as I do not read this
newsgroup. As I am considering this matter closed, replies to me may be
returned unanswered.

Wow, don't you just love this person's attitude!

Not only he posts a message to a list he doesn't follow, not only he decides
that the matter is closed, but he will not even bother to reply to messages
send to him.

I am fairly new to the net, but I bet you that Netiquette should mention
something about this kind of behaviour!

1610. >9600 bps packet (was: Re: 9600 bps radio modems)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-25 22:03:39 UTC
From: val@cs.weber.edu
Message-ID: <2s0hvr$mko@u.cc.utah.edu>
Source record: 49101

In article <CqBqo0.5Ju@eskimo.com> rdonnell@eskimo.com (Bob Donnell) writes:
>I'm suprised John didn't mention it - the new TAPR NETSIG mailing list is
>heavily involved in discussing 9600 (and faster) modem/radio issues.

How do I read this mailing list? Is it a packet-only mailing list, or
is it available to Internet users?

I'm especially interested right now because there is a local group of
amateur radio operators (including me) who want to go to multi-megabit
per second rates. We've been investigating the AT&T (NCR) WaveLAN cards.
They go 2 Mbps and are spread-spectrum. Since they are FCC Part 15
devices, there is no license required and no restrictions on content.
Equipment covered under this can be up to 1 watt, but these cards only to
1/4 watt. With appropriate Yagi antennas, we figure that we can make the
distance. We'd prefer hacking the transmitters up in power output though.

We've also heard a rumor that there is a fairly easy way to do 10Mbps
on 10 GHz.

Any pointers to this information on the Internet would be appreciated.

>But short of that, is there some approach that'll help?

>(Being compatable with the scrambled direct FSK that the current modems
>use would be a plus, but isn't required.)

What's wrong with using a squelch-derived DCD? It's possible to make a
squelch that's fast and reliable -- in the Kantronics D4-10, the squelch
response time is <well> under 10 milliseconds, and it is very solid.

Is it really true that normal VHF radio squelches today are horribly slow?
Has anyone measured the squelch speed of popular radios being used for 9600?
It may be that even the slower ones could be made acceptably fast by clipping
out a capacitor or two...

I've always questioned the idea that you want a digital DCD so that
other signals on the channel won't hold off transmission. First, if you
transmit over the top of someone because your DCD doesn't happen to respond to
their modulation scheme, there's a question of deliberate interference. But
more practically, if the signal is strong enough to override a reasonable
squelch setting, the chances are it's going to stomp on your packets, anyway.

Darryl, as you have already said, it takes a modem to make Baycom
work. It is a fairly simple device which is often packaged inside
the housing of a 25-pin RS-232 connector.

Check QST 6/94 issue, p140 for Tigertronics add of BayPac BP-1.
(800)822-9722.

Also, PacComm has a BayMod-9 and BayMod-25 (9 or 25 pin RS-232)
(800)486-7388.

There are many of these in use and they are thought to be a good
way to get started. Many users go no further. Cost is about $50.

Subject: CISCO Router to Gracilis PackeTen
To: ham-digital@ucsd.edu

We have been expirimenting with linking LAN's together using CISCO's
and Gracilis PackeTen's over low-speed (2400 baud) half-duplex radio
networks. We are using the Gracilis to interface to a number of
military radios. We are trying to show how hosts on the battlefield in
mobile platforms (ie vehicles) can be internetworked using commercial
technology with existing military communications systems.

Our network looks like this:

```
SLIP ------------- AX.25 ----------- SLIP
| | | |
v v v v
Cisco---Gracilis---Radio---> <--Radio----Gracilis---Cisco
508 Packeten ^ Packeten 508
| | |
| | |
---------Ethernet----- | ----Ethernet-------------
| | |
Host 2400 baud half-duplex Host
(SCO Unix) (SCO Unix)
```

I'm looking for others who have experience linking CISCO's to the
Gracilis, to share ideas/problems/solutions.

Thanks in advance.

Subject: ftp site to get "graphic packet" (w/ 7plus) with English doc's?
To: ham-digital@ucsd.edu

Downloaded a packet program "graphic packet" that is also suppose to
automatically identify and decode binaries encoded in "7plus".
Problem is that the doc's are in German, and very little in English.
So, I'm not sure if I can even run it on a 286 with DOS 5.0 and
an mono EGA and no windows.

Anyplace have doc.s in English? Or if it won't run on my PC, I'd
like to know that.

(Yes, I'm one of those Americans that know only one language (English),
but please realize that there are too many choices of 2nd language
and none an obvious choice, and I don't have time or ability to do
them all). :-(

Official word from a Radio Shack VP is that the radios are *not* made
by Icom. They are manufactured to RS's design by an unspecified Korean
company. However, Icom battery packs of the IC2 generation will fit and
work.

My opinion now. I wouldn't use a 12 volt pack unless I was sure it
was safe. I know the standard Icom packs work fine. I *think* it's OK
to use a 12 volt pack unless you try to run the radio off external
power or charge the battery *through the radio*. I *think* you can use
the 12 volt pack if you always charge it while *off the radio* in an
Icom drop in charger, but I haven't actually done that.

Has anyone here hooked up a Kenwood TR-7400A to a PK-88? I checked in the
manual for the PK-88 and it looks like I csan use the mike connector as the
standard 4 - pin connection given. It seems a bit generic to me and I'd like
to confirm it before I buy a connector and create smoke. I also noticed and
external speaker jack and a tone pad connector. Could these be used?

Subject: Multi-mode TNC suggestions
To: ham-digital@ucsd.edu

Since this request falls under both digital communications and equipment,
I'm crossposting -

I'm budgeting for a multi-mode, and am eyeing either the AEA PK232MBX or
the AEA PK900. What are the comments pro/con with each?

How about comparing/contrasting them with the Kantronics KAM Plus.

I'm looking for people's experiences with performance AND reliability for
the price. For now, I plan on doing a lot of receiving.

Additionally, can any of the above units receive the 137Mhz NOAA weather
satellites? If so, what is/are the requirement(s)?

Thanks for any info you can provide.

I will summarize if I get enough responses.

Scott

The 1278 supports SSTV and FAX, but unlike the other text-only modes where the
1278 does all the work, SSTV and FAX require smart software on the computer side
to transform a binary stream of nibbles into a picture. MFJ's IBM compatible
MultiCom program supports color FAX by sending (and receiving) three different
pictures or color separations. On the receiving end, the three pictures are combined
into one picture again. Really, this is not much different than the way many of the color
SSTV formats work.

Although the 1278 supports SSTV reception, all of the decoding logic is in the
software external to the 1278. MFJ can send you technical information on how
the 1278 sends the binary stream of data (the information is actually in the
technical manual that comes with the 1278), but you'll have to figure out how
each of the SSTV formats (Scottie1, Robot72c, etc.) is interpreted.

A question: when I receive WeFax - it's practically unreadable.
I.e. one can make out a few words and digits, but that's all...
Is it supposed to be that way, or should I tune up something?
[No, the LPM and IOC is correct. I'm using PK-232...]

Thanks!

>But short of that, is there some approach that'll help?

>(Being compatable with the scrambled direct FSK that the current modems
>use would be a plus, but isn't required.)

What's wrong with using a squelch-derived DCD? It's possible to make a
squelch that's fast and reliable -- in the Kantronics D4-10, the squelch
response time is <well> under 10 milliseconds, and it is very solid.

Is it really true that normal VHF radio squelches today are horribly slow?
Has anyone measured the squelch speed of popular radios being used for 9600?
It may be that even the slower ones could be made acceptably fast by clipping
out a capacitor or two...

I've always questioned the idea that you want a digital DCD so that
other signals on the channel won't hold off transmission. First, if you
transmit over the top of someone because your DCD doesn't happen to respond to
their modulation scheme, there's a question of deliberate interference. But
more practically, if the signal is strong enough to override a reasonable
squelch setting, the chances are it's going to stomp on your packets, anyway.

Darryl, as you have already said, it takes a modem to make Baycom
work. It is a fairly simple device which is often packaged inside
the housing of a 25-pin RS-232 connector.

Check QST 6/94 issue, p140 for Tigertronics add of BayPac BP-1.
(800)822-9722.

Also, PacComm has a BayMod-9 and BayMod-25 (9 or 25 pin RS-232)
(800)486-7388.

There are many of these in use and they are thought to be a good
way to get started. Many users go no further. Cost is about $50.

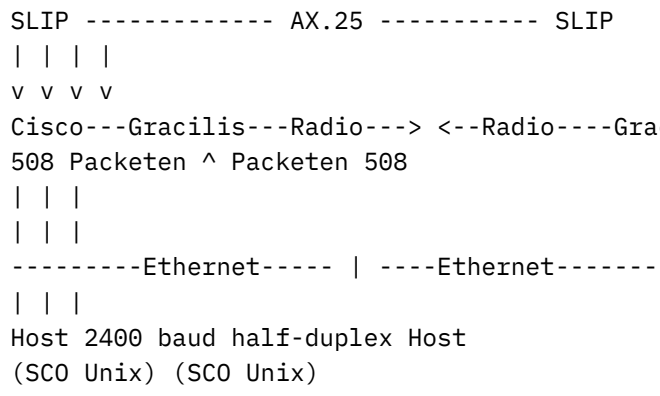
Subject: CISCO Router to Gracilis PackeTen
To: ham-digital@ucsd.edu

We have been expirimenting with linking LAN's together using CISCO's and Gracilis PackeTen's over low-speed (2400 baud) half-duplex radio networks. We are using the Gracilis to interface to a number of military radios. We are trying to show how hosts on the battlefield in mobile platforms (ie vehicles) can be internetworked using commercial technology with existing military communications systems.

Our network looks like this:



SLIP ------------ AX.25 ---------- SLIP
Cisco---Gracilis---Radio---> <--Radio----Gracilis---Cisco
508 Packeten ^ Packeten 508
---------Ethernet----- | ----Ethernet-------------
Host 2400 baud half-duplex Host
(SCO Unix) (SCO Unix)

I'm looking for others who have experience linking CISCO's to the Gracilis, to share ideas/problems/solutions.

Thanks in advance.

Subject: ftp site to get "graphic packet" (w/ 7plus) with English doc's?
To: ham-digital@ucsd.edu

Downloaded a packet program "graphic packet" that is also suppose to
automatically identify and decode binaries encoded in "7plus".
Problem is that the doc's are in German, and very little in English.
So, I'm not sure if I can even run it on a 286 with DOS 5.0 and
an mono EGA and no windows.

Anyplace have doc.s in English? Or if it won't run on my PC, I'd
like to know that.

(Yes, I'm one of those Americans that know only one language (English),
but please realize that there are too many choices of 2nd language
and none an obvious choice, and I don't have time or ability to do
them all). :-(

Official word from a Radio Shack VP is that the radios are *not* made
by Icom. They are manufactured to RS's design by an unspecified Korean
company. However, Icom battery packs of the IC2 generation will fit and

work.

My opinion now. I wouldn't use a 12 volt pack unless I was sure it
was safe. I know the standard Icom packs work fine. I *think* it's OK
to use a 12 volt pack unless you try to run the radio off external
power or charge the battery *through the radio*. I *think* you can use
the 12 volt pack if you always charge it while *off the radio* in an
Icom drop in charger, but I haven't actually done that.

A question: when I receive WeFax - it's practically unreadable.
I.e. one can make out a few words and digits, but that's all...
Is it supposed to be that way, or should I tune up something?
[No, the LPM and IOC is correct. I'm using PK-232...]

Thanks!
Regards,
Uri.

Message-ID: <58550001@hpcc01.corp.hp.com>
Source record: 49106

I bought a CP-1 a few years ago and wrote a CPM program to vary work with the non-standard (radio) baud rates. I remember QST had some ads for software that was supposed to use a multisampling technique to eliminate noise. That may be the same one mentioned in the previous reply.

If your original computer interface is 5V only, you may have to dig up an obsolete RS232 pair of IC's. The nice folks at AEA sent me a pair for free when I asked if I could buy them. If not maybe you can kluge something with a 75xxx on an IC socket.

Subject: 9600 bps radio modems
To: ham-digital@ucsd.edu

Brian,

I appreciated your msg., as I have been working steadily over the past 13 months to get 9600 packet working for one of our LAN groups here in Atlanta, the East Atlanta LAN. It's tough, really tough. I'm presently experienced with the MFJ1270 and their kit, a G3RUH actually made by Paccomm, and a TAPR 9600 kit, which I installed in my PK232MBX. Each has some uniquely good and bad qualities. I can't really say that sloppy DCD performance has been at the core of it; or at least at my experience level I don't think it has.

-> work very well. Those circuits chatter; they occasionally false on
-> background noise, and can be fooled by interference of various kinds.

I haven't seen either the G3RUH or the TAPR modem false indicate DCD, even once. I've seen it not pick up valid data (or so it looked to me) but not false.

I've been trying to work simplex right now; we don't have a full duplex repeater up yet; so we're limited to that. Also, I'm experimenting with half-duplex without a repeater.

I'm at the state where I can get each system to regularly decode another's beacon text, I can connect dependably (with an average of 1-2 retries) yet when I use mailbox features to simulate more robust traffic, often I get into retry hell. How can that be? How can I read a beacon great, connect great, just not put any meaningful amount of data through? Any ideas?

Subject: 9600 bps radio modems

To: ham-digital@ucsd.edu

-> What's wrong with using a squelch-derived DCD? It's possible to make
-> a squelch that's fast and reliable -- in the Kantronics D4-10, the
-> squelch response time is <well> under 10 milliseconds, and it is very
-> solid.
-> Is it really true that normal VHF radio squelches today are horribly
-> slow? Has anyone measured the squelch speed of popular radios being
-> used for 9600? It may be that even the slower ones could be made
-> acceptably fast by clipping out a capacitor or two...

We're getting the cart before the horse in this message thread. 9600
packet is an IF interface; squelch control is a AF section function. The
audio at the IF is always unsquelched, and rightly so. Further,
<anything> do to with the AF section screws 9600 transmissions up due to
the normal pre-emphasis and de-emphasis curcuitry in the AF section. It
seems that 9600 packet audio requires it's own custom de-emphasis based
on the exact discriminator used in order to get the eye pattern right to
the modem. Hence the difficulty of getting the IF interface right.

So...bottom line is...doesn't matter how fast/slow the squelch
is...you're way on the IF side of the squelch curcuit anyway.

I clearly state here that this is an area for ongoing discussions, as I
am not satisfied with the work I've done so far in 9600 packet, so any
help/comments/objections is appreciated.

Daniel,
I caught your broadcast response offering info. on above subject.

I'm looking for interface info on adapting the Mitrek and Micor radios
to 9600 baud use. Specifically, the modem interface and full duplex
modifications.

I would appreciate you forwarding any info you have. I am forming a
conference and file area on my ham radio BBS dedicated to 9600 packet.
Perhaps, this will make it easier for hams to complete the interface in
the future.

A "typical" modem cable will not work correctly with HostMaster for the Macintosh. Most "High Speed" modem cables will work ok. Kantronics Host Mode uses hardware handshaking.

I've used a Radio Shack RS232 Jumper Box to convert Apple 1200 baud modem cables to work with HostMaster. I can give you the wiring diagram if you need it.

BTW, I wrote (and support) HostMaster for the Macintosh for Kantronics.

From: vigra.com!steve@network.ucsd.edu
Subject: [SUMMARY] PK-232MBX vs. MFJ-1278B
To: ham-digital@ucsd.edu

I got a lot of helpful replies to my recent "PK-232MBX vs. MFJ-1278B" post. Thanks much! Here's what I learned:

Most people strongly prefer AEA's gear over MFJ. Apparently, MFJ's quality control leaves something to be desired. Some have had better luck than others, but some replies indicate that MFJ does much poorer with weak signal HF, and the MFJ leaks significant amounts of RF, which hurts some more than others. The filtering on the PK-232 is much better than the MFJ's, and the tuning indicator is more useful.

Both units are about equal for local VHF packet, where filtering and discrimination isn't too much of an issue. Many recommended checking into the KAM units or PK900 as well, but I haven't yet.

ROM upgrades for the PK-232 are more expensive ($75 + $25 for docs) than the MFJ upgrades ($25). If you plan on upgrading often, this may be an issue.

It's true that only the MFJ does SSTV and shaded Fax, so for those who use it for that, the AEA can't substitute. However, most replies recommended getting a basic Fax-only box if Fax is going to be a significant factor. The AEA-FAX (~$100 hardware & software) is well recommended.

Apparently, AEA doesn't provide or make available any software to decode the Fax data from the PK-232, making it pretty useless. MFJ is a better about it, but doesn't get along with Windows very well. The MFJ software may also be minimally copy-protected, which seems odd.

The internal BBS feature on the MFJ (pbbs) seems a bit better than the PK-232's (PakMail). People like the CHAT command and some auto-forwarding features. It sounds like gobs of RAM aren't really an issue for personal mailboxes with medium traffic.

Overall, it sounds like the PK-232 is a much more reliable unit for Packet and other modes, but if SSTV or Fax are critical, MFJ or specialized boxes are the only option. Many suggested starting with the inexpensive Baycom (~$50), but it only work's on DOS machines.

Thanks very much for all your responses! Especially these helpful folks:

There are two programs that I know will work... One is TOR... I don't remember the version... I think the last was TOR30x.ZIP... This was shareware... I also forgot the author...

The software that I use is BMK-MULTY... I am using a HAL CRI-200 modem... BMK-MULTY, written by G4BMK, is the ultimate RTTY/AMTOR/PacTOR/CW software for dumb modems... While the initial cost is high, and the software is not resaleable, because it is encoded with your callsign, it allows the use of simple, good and affordable old-style HF modems... Upgrading your modem is then relatively easy...

Check the back of QST for info on BMK-MULTY...

I HAVE BEEN RUNNING BAYCOM SOFTWARE FOR AWHILE NOW AND I LOVE IT.
I HAVE ADDED THE YAPP DRIVER AS WELL AS A 7PLUS ENCODER/DECODER.
YOU WILL NEED A BAYCOM MODEM TO CONNECT THIS TO YOUR RIG.
I RUN ONE THAT IS A KIT FROM A&A ENGINEERING.
THE BP-1 FROM TIGERTRONICS WORKS NOT TOO BAD EITHER BUT IT DRAWS IT'S
POWER FROM YOUR RS-232 PORT SO I PREFER THE A&A UNIT AS IT HAS IT'S OWN
POWER SUPPLY.IF YOU ARE INTERESTED IN MY MODIFIED VERSION OF BAYCOM,
JUST DROP ME A LINE AND I WILL SEE WHAT WE CAN DO.

Jim

I found the same thing when I examined the docs as well. It appears that
there must be some provision for sound boards as you have the ability to
direct the output of the program to the speaker, serial port, parallel port,
or serial device.

A friend of mine uses the logitec borard and has no problem in getting the
program to run on that board. The problem appears to be the Sound blaster
board only.

Subject: TNOS and NETROM.

To: ham-digital@ucsd.edu

Hello,

I see there's no NETROM facilities into the TNOS compiled distribution.
I have some difficults to recompile the TNOS with BC 3.1.
I ask if someone includes the NETROM facilities into the TNOS and if
it's possible to send me the exe.

I test the TNOS on a 286 and sometimes the system hanged and stop.
I assume it's probably due to a lack of memory (only 2048 K) because
the
system stop when there are some connected features and only 12000 Bytes
free.

Could you help me to boost the memory process.

Many thanks.

Pascal.

Subject: TNOS Configurations files and facilities needed.
To: ham-digital@ucsd.edu

Hello,

I try to use the NEWS facilities into TNOS so called NEWS Center.
Unfortunatly, I don't see any groups or like that when I connect the
NEWS Center. I suppose I must configure some files. Into the
autoexec.nos I start the NEWS, INFO and TUTOR server. At first, I try
to have a NEWS center with more than two choices. I give the names for
these facilities. But I only have two choices.
Into the directory NEWS or NNEWS, some files must be configured I
suppose.
Into the directories INFO and TUTOR it's probably the same.
Could someone help me to find the proper configurations to have
NEWSgroups.
Could someone help me to find or send me configurations files samples.

Best regards and many thanks.

Pascal.

Dick Hale (dick.hale@woodybbs.com) wrote:
: Can you tell me if the TEKK Radios have an audio modulator.. or only
: a shift line for data ?
:
The TEKK "micro" radios have a linear transmitter input with no deviation or
bandwidth limiting or shaping. Your signal is coupled directly to the
modulator. The receive signal comes right from the demodulator chip with
no shaping. I didn't look right before I wrote this, but there are probably
coupling capacitors used in both lines, limiting the ultimate low freqency
response, but it passes the K9NG/G3RUH TX signals with very good fidelity.

The TEKK "mini" radio has deviation limiting, high and low pass filters in
the TX path, and high frequency roll-off (3 kHz?) in the receive path. The
TX signal is probably good enough (better than most radios who's PLL is
modulated) for 9600, but the receiver needs to have the low-pass filter
modified or bypassed - otherwise there is too little high-frequency
component and a strange looking eye pattern.

I'm suprised John didn't mention it - the new TAPR NETSIG mailing list is heavily involved in discussing 9600 (and faster) modem/radio issues.

Quick comment: Regarding copying beacons, and being able to connect, but not move much data, you could be seeing two things:

1) Your radio TX to RX switching time is cutting off the other station's header, giving your modem inadequate time to syncronize on the incoming data stream, or
2) You're seeing the result of a high bit-error rate.

I favor the latter, because you imply that you don't usually get connected on the first attempt - 1 or 2 retries required. The longer the packet, the higher chance of an error. A connect packet (bare AX25) is less than 20 bytes (less than 160 bits), not including pre-frame flags. A packet with 256 bytes is over 2200 bits. If you are having trouble getting less than 160 bits through error-free, you are going to have almost 14 times more trouble getting 2200 bits through without an error.

Also, as a side note, when we've done testing here on link reliability we usually are using the 'ping' feature of tcp/ip and NOS to do the testing. We run 'datagram' (unconnected) mode and usually use 200-400 byte packets. I have noticed that with two analog modems (TAPR on one end, PK-900/PK-96/TAPR/G3RUH on the other) that the best ping response I can get is about 95% through our TAPR bit-regen modem equipped 2M repeater. This is over about a 45 mile line-of-site path. Switching to a DSP-2232 will improve the ping return rate to about 98-99%. Kudoes to N4HY. Note that due to atmospherics (ducting, etc) and the fact that the repeater is at about 5000 feet we have times when the path to the repeater is poor to unusable, too. This is part of why our next generation of repeaters are at low altitude sites, mostly cell sites.

Way I have my TNC hooked to my Mac is thisaway...I use a high-speed modem
cable from my Mac to a switch box (8-pin DIN -> EIA-232 connector) and
from there have two EIA-232 cables going out, one to my Modem and one to
my TNC. Be warned, though...use SHIELDED cables all the way through.

Subject: Baycom problem
To: ham-digital@ucsd.edu

Baycom will work with very low signals if it is set up right. The
software isn't the best, and I recommend that you get your hands on Sp6,
Graphic Packet, or Mubay.
Anyway to make the modem a lot less deaf, link pins 11 to 7 on the
7414 Ic. This connects an used inpput of an inverter to ground, as should
be the case on all 74 series ICs.
I found this to severly improve reception of low signals and it also
cuts down on rejects sent and recieved.
Also have you setup the recieve potentiometer properly, 2.7 V is not

always the optimim value.
Fiddle with it in graduall steps and see. But do link those pins.

: >
: > -David N9PGH
: > davids@truevision.com
: >
: >

: Use the example in the TNC manual for any ICOM handheld. 2AT 3AT 4AT etc.

A resistor is usually specified with a value of 22k or 30k in Icom
connection information. If this value is replaced with 2200 ohms, then the
same cable can be used with: All Icoms using seperate mic and speaker
connector, All Alinco with seperate mic and speaker connectors, all Yaesu's,
all Radio Shacks, and all Standard's.

: "All the science I don't understand, It's just my job five days a week"

Hi Stuart,

The info is pretty generic, because unless your TR-7400 has been modified,
that connector info really does apply to all Kenwood transceivers using that
connector. When I was with AEA I was responsible for gathering and
verifying all the radio connection info, and Kenwood was kind enough to
confirm it. You could probably use the TT pad input, but with no PTT
connection it probably isn't very useful. Also, that radio tends to have
very poor audio characteristics for packet, primarily too much de-emphasis,
as I recall. 7400's I can remember listening to roll off the high-frequency
audio on receive for packet more than most TNC's can compensate for. If you
have schematics you might be able to locate capacitors that can be removed
or replaced with lower values to correct this.

Subject: Packet radio inquiry
To: ham-digital@ucsd.edu

Hello,

My organization will be buying some telecommunications soon, and one of
the options we would like to examine is setting up a packet radio link.

Here is the situation: Our campus operates on a digital phone system,
and the people who run the digital phones are very stingy about giving
out analog lines. We would like to have an analog line to set up a fax
modem. Barring this we would have to spend about $350 extra to get

something called a Terminal Adaptor Unit installed, and that would give us
9600 BAUD connection to the local computer network on a separate data line,
but no fax capability. (Not to mention the phone itself costs around $200)

The idea occurred to us to use a packet radio to link to a volunteered
data-line. They undergrads are given free digital datalines in the dorms,
and we may have a member off campus, even better, willing to install an
analog line and set up our computer's fax modem there. This would be
cheaper and preferable. We may even be interested in a second radio
which would send/receive voice calls on an off-campus phone, but we would
probably like to scramble the signal.

Any suggestions? Assume we will not be able to put up an outdoor antenna(sp?)
Also, we would like something more or less pre-packaged and simple. Assume
a budget of $300 for the packet radio and $200 for the voice radio. I am
clueless as to how much these things generally cost.

Thanks for any help.

Brian

Subject: SoundBlaster ASP and Radio
To: ham-digital@ucsd.edu

Some time ago, a fellow posted that he had received the Creative Labs
SoundBlaster ASP developer's kit, and was going to undertake writing a
packet TNC in software, using the sound card hardware.

I can't find the original message, but am quite interested in the status of
this project.

In addition, I'm interested in work to make a PC with sound card into a nice
simplex repeater controller. The possibility of linking two such systems via
the Internet is interesting.

>caps a bit smaller here and there.

I'll have to draw up the circuit used in the D4-10 (based on the '3362 IC) -- it's very fast, and listens high enough that it works fine on 19.2 data (ie, maximum 9600 Hz components).

>The best solution I've come up with was to simply have a ZERO DDO - in

>The Mitrek has some power sequencing circuitry in it to ensure that the
>transmitter doesn't produce power until after the antenna relay has
>changed over; I'll have to bypass that too.

We've been running our 19.2 repeater with 0 hangtime and it works very well. At the moment, the repeater is built out of a pair of D4-10 radios (I want to replace at least the transmitter with a modified commercial unit ASAP, both to get some more output power, and to free up a $350 radio for other uses). The receiver squelch drives transmit PTT through some minimal control and timeout circuitry. There's no delay built into the system at all.

Actually, this method of operation is necessary for us, since we're using squelch-derived DCD on all the radios in the system -- a hangtime would render the network useless.

Anyway, the delays introduced by running the repeater this way are pretty minimal. On the test bench, two of the D4-10s can talk to each other directly with a TXDelay of about 8 to 10 milliseconds (using the Ottawa PI card, which

has 1ms timer resolution). Through the repeater, a TXDelay of 20ms works
fine, so the added delay is pretty minimal.

In the real world, we work through the repeater with a TXDelay of 50ms,
because some of the stations that are driving KISS TNCs with G8BPQ seem to
have problems with shorter delays -- I don't know why.

: the-correct software I can run TCP/IP. What do I need and where can I get
: it? A description, at a top-level, of how this all works would also be
: appreciated. -
: _____

There is a driver called "AX25.COM" which can be used to allow a Baycom modem to be used with a TCP/IP package. I don't have a source for you at the moment, but you should be able to go on to an archie server and do a search for that program and find a few sources of it.

Be careful to get the latest version that you can find (Late 93 or 94). Earlier versions had some bugs. Also, I found that with my Baycom, it didn't generate enough power (it pulses the TX lead for this purpose) to allow the self powering features of my modem to work, and I had to externally power it.

Here's a different subject...

What specific brands/models of PCs have folks found to be particularly
good or bad with regard to RF hash generated, and suseptability to
RF fields?

I'll start: my Compudyne 38625SXL (Twinhead) notebook is pretty good as far
as generating noise, below 10.15 Mhz. On 20 meters, and up, it's
pretty much of a disaster, growing worse as the frequency increases,
even when run on battery power and equipped with split ferrites on
all external cables. The LCD display seems to be part of the problem.

On the plus side, it tolerates fields which are equal or greater to
what the PK232 can take.

Ergle. I'm having a prob that I hope really isn't one...
I've got a Micropower-2 TNC hooked up to my computer, but don't have
the radio hooked up yet (haven't got the cables and can't quite figure out
how to wire it to the HTX-202/ICOM 2AT config). Well, I decided to switch
it on today to play around with the commands and...nothing. I've done this
before and gotten a nice startup screen followed by the "cmd>" prompt, but
today I got absolutely zilch, though it does echo characters and character
returns back to the screen so I don't really think anything's fried. Am
I in some sort of weird mode somehow, and how can I get it back out of it?
Or am I f***ed?

Will somebody who's hooked their PacComm Tiny-2 OR Micropower-2 TNC to
either a Radio SHack HTX-202 or another ICOM 2AT-compatible HT please
e-mail me the wiring configuration? I've got a Micropower-2 but the
company is currently out of manuals so I don't know how to get it
wired.

: >interrupts for as long as it used to.

: Actually, many of the SCSI adapters, such as the 1542 from Adaptec, are
: BUS MASTER devices. This means that the main CPU cannot get on the bus
: to service interrupts at all during some periods. Bus mastering is a
: desirable way to improve performance for DMA on disk controllers. Expect
: to see lots more bust mastering on the newer bus achitectures.

No, I have a 1542 in my Linux box, and it does not steal enough cycles to
cause a problem with anything :-)

: >
: >Bottom line is, you must use the timer interrupt for polling as it is
: >the highest priority; and also you had better have as good (or better)

: >this time, and see if you missed any ticks (by checking against a
: >real clock). You should be able to nail down the maximum tick rate
: >permissible and then decide if this is fast enough sampling for your
: >application.

Yes. With a 386dx33, you can get 20k interrupts per second. That's
an order of magnitude more than needed. On a 486dx2-66, 70k. On
even a 386dx33, the impact on system performance would be acceptable,
perhaps even go un-noticed! Seems I was wrong... this is do-able.

: Bottom line is, a PC's main processor makes a terrible SCC controller.
: the BAYCOM and PMP approaches are neat little hacks that really can
: only work when you're talking about a DOS based machine that can run
: without any preemption. Windows, Unix, Linux, OS/2, and most operating
: systems have preemptive scheduling. Sure you can tweak them to handle
: the timing needed for a $50 BAYCOM modem, though you run the risk of
: having to spend considerably more on enough computer horsepower to
: hit the timing windows, and enough of your time to make it non-cost
: effective.

You are right, of course. It's not a good solution, but cost effective?
I think so. No, there's no profit to be make, but once the code is
written, packet under Linux is much more affordable for those that don't
have (or want to spend) the extra for a real TNC.

: What I find odd, is that spending another $50 to get to $100 and buy a
: real TNC, that can handle the synchronous communications of the packets
: on the air, handle the HDLC framing, etc. is MUCH simpler than trying
: to hack a multi-threaded or multi-processing OS into being able to
: handle a BAYCOM modem. Sometimes the hardware solution is cheaper...

It's only cheaper the first time. If it could be made to work, BAYCOM
style modems for Linux would open up packet to new users for far less
than any other solution.

1630. DSP questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-26 19:49:35 UTC
From: n4zr@netcom.COM
Message-ID: <Pine.3.89.9405261212.A3866-0100000@netcom6>
Source record: 49112

Is anyone out there aware of any experiments done in the use of DSP to produce simulated spatial displacement of audio tones as a function of their frequency? What I have in mind is being able to spread a pile-up by having the lower-frequency tones appear to be on the right and the higher ones on the left, in an experiment to see whether that helps pick out individual signals. Could such a thing be implemented using an ordinary sound-card with stereo outputs as the interface?

73, Pete

Just such an analog design appeared in one of the amateur pubs a couple of years ago. It was a low-pass filter to the left ear and a high-pass filter to the right ear. It could easily be done with a soundcard.

>(ducting, etc) and the fact that the repeater is at about 5000 feet we have
>times when the path to the repeater is poor to unusable, too. This is part
>of why our next generation of repeaters are at low altitude sites, mostly
>cell sites.

Here's another data point: we do our testing on the 19.2 repeater the same
way, via ping, usually with a 256 byte packet and 3 or 4 second interval.

We also see ping hit rates of about 95% at best, 85% or so at worst,
through the repeater (with reasonable but not pile-driver paths, and some
other activity on the system). In bench tests, we get up to 98-99 percent.

The non-returns generally are about evenly spaced, with occasional clusters of
two or three drops in a row. Even over very long tests, we almost never see a
run of more than 100 pings without a drop.

This is using the D4-10 as an RF modem, directly driven by modem disconnect
header or PI card. No scrambler. And, unfortunately, no bit regen (yet).
I'm very interested in seeing whether adding bit regen is going to improve
error rates generally, or only help on marginal signals. We're hoping to add
a regen later this summer (once I can get a TAPR 9600 modem kit to butcher).

From: cll4@Ra.MsState.Edu
Message-ID: <2s35o6$5pe@Tut.MsState.Edu>
Source record: 49133

We are currently trying to get a VHF packet net started to increase the general use of packet in our area. We have been having trouble deciding what format to use to get everyone together. We have considered an unproto via 2 area digis, connecting to a net/rom (I think) node and using a talk feature (which sends each user's packet to everyone individually), and are out of ideas of a smooth way to accomplish this. There will be some people who will have to digipeat to get into our area. Any and all ideas will be welcome, and if anyone has such a beast currently running, I would love to hear from you.

Thanks in advance,
Craig

>How do I read this mailing list? Is it a packet-only mailing list, or
>is it available to Internet users?

ObPlug:

The TAPR NetSIG mailing list is devoted to discussion of amateur packet radio networking issues. It's not limited to hardware discussions, though there's plenty of that going on right now.

To subsrcribe, send a message to listserv@tcet.unt.edu with "join netsig" in the body. To submit messages, send to netsig@tcet.unt.edu.

Note: the list has been very busier -- busier than we had ever hoped -- and as a result we recently had to change homes, and there have been a few bugs in the system. Please bear with us.

John AG9V
jra@lawdept.daytonOH.ncr.com

PS -- No, I don't know much about the NCR Wavelan stuff, despite my address. I wish I did, but I've never been able to get my hands on any surplus units.

Ah, but to get spacial placement, what you want to do is alter
the phase delay to each ear and keep the amplitude flat. The
stereo effect is a function of phase, not amplitude. Each channel
should be an all-pass function, with symetrically opposite group
delay curves. Several years ago there was an analog circuit published
in, I believe, Ham Radio that did just that.

Some time in the early 80's, like maybe '83, there was an issue of
either IEEE Spectrum or maybe the Proceedings of the IEEE that was an
anniversary issue of some kind. The contents were seminal
papers in several areas, one of which was a great paper on
stereo audio and how it worked. This was when "Stereo Hi-Fi"
was new and nifty stuff. (BTW, the other papers in the issue
are equally nifty.) Anyway, go read the stereo paper and the
silliness of using amplitude to get spatial placement will be
quite apparent.

The DSP version should be pretty simple -- Do an all-pass with
linear group delay on one channel, and simply delay the other
channel to place middle tones in the middle of space.

1636. NOS with the Baycom Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-27 02:40:39 UTC
From: jangus@skyld.grendel.com
Message-ID: <770006439snx@skyld.grendel.com>
Source record: 49108

Jeff Please forward this to the appropriate newsgroup/individual
TCP/IP WITH NO TNC
By: Mike Hooper, KF6PU
TNCs run in the kissmode and SCC cards such as the DRSI PCPA have long been the staple of most TCP/IPers running NOS and Net versions of the KA9Q Internet Suite of Protocols. There is a much less expensive and more elegant solution for a 1200 baud hardware interface.
"Baycom" style modems have enjoyed international popularity for some time now among those running packet software that employs the "software tnc" approach. Baycom, PMP, and Eskay Packet (SP) V6.10 with the TFPCX driver are very popular.
Most Baycom style modems are designed around either the AMD 7910 "World Chip" IC , Texas Instruments TCM 3105, or the EXAR 2206/2211 pair. Most commercial TNCs use these chips for the modem section. For example, the AEA PK-88 uses the AMD 7910, The Kantronics KAM and KPC-4 use the TCM 3105 for VHF-UHF ports and the MFJ 1270/1274 use the EXAR pair. Few external parts are required for these modems and they are easy to construct. The TCM 3105 modem can be built for under $25.00 and can be built so small as to fit into a DB25 shell.
Thanks to the efforts of Pawel Jalocha, SP9VRC (SP9VRC@SP9ZDN.POL.EU) (jalocha@chopin.ifj.edu.pl) a packet driver conforming (to a sufficient extent) to the "FTP packet driver specification" has been developed that serves as an interface between application software (e.g. KA9Q NOS) and a modem connected to the RS232 port (e.g. Baycom modem). This driver along with documentation and accessory files have been distributed in this country under the filename "AX25DRV.ZIP" . Be sure to use the January 4, 1993 version as prior releases have bugs.
Jawel's packet driver enables the use of unsquelched audio as the driver is able to deliver "channel busy" status by analyzing incoming data.
The driver is loaded into memory before NOS is run. The utility "TERMIN.COM" is used to remove the driver from memory when one exits from NOS. Below is a batch file that sets up the driver for use on COM2 with NOS :

```
@echo off
c:
cd\net
ax25 -b1200 -B2f8 -I3p -cd -h350
nos.exe
termin.com
cls
```

The switches invoked with ax25.com specify: 1200 baud, COM2, IRQ priority (given to IRQ 3 in this example), carrier detect option, and txdelay. Slottime and persist default to 100 msec. and 64 but are adjustable with the -s and -p switches. The software interrupt defaults to 0x60 but is

adjustable from 60 through 63 with the -i switch. Carrier detect threshold
and TXtail are also adjustable with the -T and -t switches. A switch need
not be specified if the default value is used.
Within AUTOEXEC.NOS is the following attach statement (your version of
NOS must be compiled with the attach packet hardware interface option):
attach packet 0x60 144 5 256
I have been using this driver with both the WG7J and KB7YW versions of
NOS for several weeks. My system utilizes three hardware interfaces two of
which are handled by a DRSI card. During this period I have had the
opportunity to use a KAM (v6.0), PK-88, and a PK-232 with the TAPR DCD mod
and in no case have I found these superior to a TCM 3105 modem used with
Jawel's ax25 driver. The driver does not work well on an XT clone. My
computer is a 386-33 SX using a pair of 16550 AFNs. I find it useful to
reset the computer before running NOS to "clear" the comports.
Work is currently in progress on adapting the G3RUH 9600 modem for use
with the AX.25 driver. Potential problems concerning interrupt latency
issues may complicate matters. If success is achieved it would
substantially reduce the cost of running TCP/IP at 9600 baud.

Come on, Dave, what you are talking about is speakers. We are talking about headphones. With headphones, all you need is different amplitudes depending on frequency. On my DJ-580, 2m comes into my left ear and 440 comes into my right. Should I worry about phase? If low frequencies come into my left ear and high frequencies come into my right ear and at 800 Hz they,re equal, I've solved the problem without worrying about phase. Of course, the only way to do that is to use headphones, NOT SPEAKERS! Go back to your gold-plated stereo connectors and leave us hams alone! :-)

Pete, you don't need a sound card or a PC, just a pair of stereo headphones.
Build two triple section (18 dB per octave) audio filters, one low-pass with a corner of 680 Hz and one high-pass with a corner at 950 Hz. Note that you don't want the corner freqs equal to the center frequency, you need to spread them out a bit to get good left/right isolation fairly quick as the frequency slides up or down.
You might also consider some of the newer DSP filters that can pass the desired frequency +/- about 2% and intelligently notch other tones rapidly. And of course the DSP manufacturers who want greater sales to the hams should consider adding a CW mode that functions as noted. My son uses such a unit in his commercial audio reinforcement business all the time, trademarked as "Feedback Exterminator." It sells under $500, and with 50% markup at the retail level the dealer cost is under $250. The unit is also available as two smart-filters mounted on one 1-7/8" rack panel for stereo applications for $895.

Message-ID: <9405271659.AA08826@pvareill.apple.com>
Source record: 49116

Hello,

I'm still developing a Macintosh application to decode weather fax. To do
that, I use an interface made by a german amateur, EasyFax. To drive this
interface, I look for a source code or library to drive individually each
signal on 8530 : Transmit, receive, handshake in and out, GPi.
Don't bother anyone with this. Please reply directly to me.
Thank's in advance.

For those digitally enabled hams who are in-
terested in exploring the KC7WW PC soundcard
application - you can get a Cardinal DSP16 for
$79 at the PC Connection 1-800-243-8088 plus
about $5 s/h. Good deal for a programmable
ASP based DSP PC board.

F.Y.I. and Happy holiday weekend to all.

I've done this with analog circuitry, and what gave me the original idea was making homebrew headphones. Using what I had at hand resulted in speakers with different characteristics, and created spatial displacement - and sure made the pileups easier to figure out, especially as a novice.

I use one on packet. I think that I wired the audio through
to the 4-pin mike connector. If you don't want to go to that
trouble, then you can use the external speaker jack.

The tone pad input can accept audio but will not give you
the ptt that you need. So go with the mike jack.

Well, yeah Cecil, by varying amplitude to each ear you can get
a kludgy approximation of the stereo effect. My point is that
human psychophysiology is wired for synthesizing the spatial perception
of sound source from *phase* data not amplitude. Using amplitude
is fighting Mother Nature, and using phase is feeding the brain
information in the form it is optimized for. I would argue that
matching our machines to us is a friendlier philosophy that matching
ourselves to our machines -- ergonomics, in other words.

In any case, in a world of DSP CAD tools, it is equally easy to
synthesize either filter. Might as well do the thing well, if
you have the tools. Now... can somebody point me at some good,
cheap/free, bug free, well supported filter synthesis software? :-)

: Now... can somebody point me at some good, cheap/free, bug free,
: well supported filter synthesis software? :-) 73, Dave NG0X

Tell you what, Dave... let me plug a filter synthesis software supplier. Momentium Data Systems in Southern California to whom I have no connection except satisfied customer, has free demo software available. With it you can design filters to your heart's content but the free stuff doesn't give you the coefficients. But from the graphics of poles/zeros, you can calculate the coefficients and re-enter them to see if you got them right... or you can design your filters, send me the filter specs, and I'll run the coefficients for you. How's that for a deal? Are you on ccmail? I'm at home running remote access right now so I don't have MDS address at the moment. I've used this filter program to generate coefficients for 80C196 applications and it works like a charm, even the sichofisiologikal stuff.

1654. HELP with autoexec.nos please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-05-28 13:31:56 UTC
From: wy1z@meceng.coe.neu.EDU
Message-ID: <9405281331.AA04834@meceng.coe.neu.edu>
Source record: 49128

I recently FTPed a copy of osview to get started once again into TCP/IP packet.

I edited the file with my info: my ax.25 and TCP/IP callsigns, my IP address, etc. I also remembered to edit the interface info to communicate with my tnc at 9600 baud - and we are all playing happily on com1.

Or so we should be...

I start up NOS, and it appears to initialize just fine - no error messages.

I then type: telnet destination_IP_address, and the screen clears with the message that it is trying to telnet to that IP address, but the modem's LED's don't do anything, and the TX light on my radio never lights.

I've successfully used TCP/IP packet before, but when I really got heavily involved with the Internet, I dropped the Amateur end. I now want to get back into it.

If someone could please help me, either by stepping me through the important areas of the autoexec.nos file (which I would love), and/or sending me their working autoexec.nos file, pointing out to me what areas to changeso I can use it on my end, I'd greatly appreciate it.

I did look for an area in the file to define my router's info, but the comments in the file didn't make it too clear.

I've studied the sections with comment lines:

Setup AX.25 routing

Setup the ARP table

Setup IP routing

Yes, the above line is clear, but the command structure looked too confusing.

Any help would be appreciated.

Thanks much!

From: hamilton@BIX.com
Message-ID: <hamilton.770132578@BIX.com>
Source record: 49134

I notice a few radios (e.g., Icom IC-281H, Alinco DR-1200TH2, Kenwood TM-255A, Standard C5718DA) explicitly described as supporting 9600, but with the exception of the Standard unit, all are single-banders. I don't see any mention of high-speed packet support in other new, high-end radios like the Icom IC-D100 or Kenwood TM-942A tribanders, or even most of the dual-banders.

Should I generally assume that unless the vendor specifically claims 9600 support that it probably will not work with any given unit?

Message-ID: <2s80fu$o9a@news.icaen.uiowa.edu>
Source record: 48952

Quick question about addressing packet mail. are the two spaces around the "@" critical? Ie, is "N0YVW@W0IUQ.ia.usa.na" the same as "N0YVW @ W0IUQ.ia.usa.na" or will the second get the mail there (here, in my case) but not the other? I notice that mailheaders tend to use the first form without any trouble, but I was curious (I'm new to packet and I sent some mail using the first form rather than the second and I'm curious to see whetherit'll actually get there).

Tnx, Doug

You can use either form of the 'callsign @ BBS' string on most BBS
software that I've used. The 'standards' say that the '@' should be
surrounded with white space, but that BBS software authors should code to
parse the string without the white space.

There are a set of perl scripts that do this (called tpage), and I believe
perl has been ported to MS-DOS. There's also a mailing list for the IPX
protocol, though I can't remember the address right off hand.

I would suggest archie'ing around.

-> ICOM 2AT-style speaker-mike and battery interface.
->
-> --

Well, I decided that the engineers at RS couldn't be so dumb as to
design a radio that uses the same battery pack interface as Icom, but
burn something out if you actually tried to use some other brand of
Icom-interface battery besides theirs. So, I slipped on my
Periphex BP-8S (9.6v) battery pack and ........ it works just fine!

Still, I'm not sure if you can use a 12v battery pack though, but I'm
willing to bet you can.

I had that problem myself until I realized I forgot to put my TNC
(PK-232) into KISS mode. Regardless of your make/model, the book can
tell you how. If the TNC has battery RAM, you can put it in KISS mode
with any regular packet program and leave it that way. Then in NOS, it
will be there.

If that still doesn't do it, e-mail me and I'll send you my
AUTOEXEC.NOS.

Thanks for the offer, but I finally figured it out. The problem was that
autoexec.nos was calling another program, too, called kisson.dia
It was this other program which had a baud rate set to 4800. Autoexec.nos
was set to 9600, so it was talking to the TNC, but the other program also
needed its baud rate changed. As soon as I corrected that mistake, the STA
LED finally went back out, and I could connect.

Now, for some success in connecting to other IP stations via the one I
have my IP address from...

73,
Scott

I have a Packard-Bell 386 (Axcel 100) located about a foot from the rig, and it's absolutely quiet. Unfortunately, the monitor I have is a Compudyne 14/640V, which generates an incredible amount of hash between 10 and 20 meters, with 15 meters being by far the worst. I've tried numerous "fixes," but the only thing that works is turning the monitor off when operating SSB, and then turning it back on to log the QSO. Frustrating, but it works!

On CW and the digital modes, the bandwidth is sufficiently narrow that I can normally get a decent signal-to-noise ratio even with the monitor on, so I don't have to operate RTTY with the monitor off, which would be a REAL challenge.

From: rogjd@netcom.com
Message-ID: <rogjdCqMG2x.B3F@netcom.com>
Source record: 48963

My TS850S/AT is in the shop, so I can't work digital HF right now. So I'm on the Internet a lot :-)....

What is the consensus on GTOR? I saw a thread on this newsgroup to the effect that it differred very little from Pactor in its performance. This thread went on to maintain that only Pactor II could really exceed Pactor in terms of thruput. (Strange lack of reference to Clover?)

On the other hand, the claims of Kantronics make one believe that GTOR approaches GTOR, and presumably Clover, without forcing a complete redesign of the TNC to give it 4-tone capability.

Since I'm temporarily off the air, and cannot discuss it directly that way, I'd sure welcome some discussion on this topic! What is GTOR like? Is it going to be the "digital mode of the 90s?" Or will the other TNC manufactureers debunk Kantronic's claims and cause GTOR to fade away?

From: wa2ise@netcom.com
Message-ID: <wa2iseCqn9vq.Fxz@netcom.com>
Source record: 48967

Just a quick comment that Telix 3.22 (I think that's the version #, well close anyway) was the only modem software that didn't barf when uploading a file that was prepared with 7plus (converts *.exe and *.com PC executables so they can be sent thru the packet network, also has error correction). Other modem software, like Crosstalk, PCmodem, PTP, and an old copy of Qmodem would choke (do bad things like disconnect, excessive line feeds, and such.). I also had to set the TNC to Xon/off to OFF. So that hardware handshaking is used. Even so, only Telix would work correctly. Telix is a shareware program, ftp-able from various sites like garbo or oak. Look in the *.binaries.* groups.

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

Lots of luck trying to work with MSYS stations. MSYS's author has been
generally unresponsive about fixing the IP implementation in his software,
and it has been known for a long time to have some serious deficiencies when
it comes to issues like fragmenting big IP packets, etc.

>besides theirs. So, I slipped on my Periphex BP-8S (9.6v) battery pack and
>........ it works just fine!

>Still, I'm not sure if you can use a 12v battery pack though, but I'm willing
>to bet you can.

Not all the ICOM radios will work with the 12v battery packs either! Don't
try it with a IC-2AT or IC-4AT, for instance. ICOM originally did not make
a 12v pack, but added it after introducing the IC-02. The earlier radios
don't have a charging/external power jack either, although ICOM did make a
12v to 9.6v converter which fits on the bottom of the radio like a battery.

Keplerian elements are posted weekly to rec.radio.amateur.space and
rec.radio.amateur.misc. Current elements are usually also available
on packet BBS systems.

I used to have this problem with a monitor that was about 6-feet from
the rig. I attached some wire to a piece of aluminum foil, and wrapped
the connector at the back of the monitor. I then cut the wire in
increments until the noise was diminished. Still had RFI, but changed
the frequency of it.

At one time, I had a computer that would totally wipe out a TV set that
was two rooms away. THAT is RFI.

From: bat@gdstech.GRUMMAN.COM
Message-ID: <BAT.94Jun1063618@gdstech.GRUMMAN.COM>
Source record: 48983

Any time you are sending binary files over a modem you run the risk
of wierd things happening, as the XON/XOF characters are encountered
in
the stream. Using hardware flow control is almost always a better bet.
Set your comm software (and sometimes a modem setting is needed) to
use
RTS/CTs and you will have lots fewer transmission problems. BTW, I use
the new MSKermit, and it works great, and is free. -pat

Source record: 48986

Gary, you should be getting a copy of this on Packet as well, but I thought I'd toss it out on Usenet as well for others to comment upon.

I recently came across a note by you in our local Packet BBS archives dated 12-MAR-92. You probably don't remember having written it, but it was a response to a UK user's request for information on packet applications.
Your response was that there was so much potential for packet, but that right now, aside from local packet BBS's and packet mail, there are none, diddly, zippo. You said that, you expected it "to fall into a 1200 baud and C64 forever mindset that never reaches the heights it is capible of scaling."
Well, two years later, I see you as being 100% right. I've not been in packet that long, but what I've seen makes me believe that the case may be worse than you depicted it then. I'll use the Iowa packet network as an example. It's a fairly extensive network, you can get into it from pretty much anyplace in the state on 2-meters. But I have the network map here in front of me...and that's about all it is, 2 meters. There are only a handful of 9600 baud connections throughout the state, and those are mostly to get *into* nodes, not links between the nodes, and the few which are backbone links don't even connect the major nodes. I hear people talking on the linked repeater system about mail moving "fast" today--only taking 16 hours or so to make a 3-link trip. Needless to say, I have a hard time swallowing that.
I realize that much of this is simply the way the local net is set up, but the way it is set up reflects the mindset of which you wrote. Also, from my conversations with other packeteers, this sort of setup is not uncommon.
But what can be done about it? It seems to me that newer, more efficient protocols need to be developed *and actively promoted* rather than making 10 or 15-year-old technology the standard.
A new implementation of TCP/IP might even help the situation. While the TCP/IP protocol suite is far from perfect, it seems to be much more efficient than the network we have now. But the current implementations, while pioneering in their time, are currently out-dated. IMO the best way to update our current technology would be to develop a device driver for the standard TNC in KISS mode. This device driver would allow standard TCP/IP implementations and apps to interface to amateur packet radio transparently. It seems to me that there is no reason that standard TCP/IP applications which run on the Internet should not be able to run on a Packet radio internet, including standard implementations of ftp, telnet, rlogin, usenet news, internet bbs's, etc. I have been dabbling with such a device driver,

but I do not pretend to either be a professional programmer (I'm a writer by trade) or to understand the AX.25 protocol or to understand KISS.
Furthermore, this would be an excellent avenue to bring new blood into Amateur Radio. I've mostly grown up with computers, but as great as my understanding of them is, I don't have the intuitive understanding that those even ten years younger than me do. I've only been using computers since I was ten or so...these kids currently in high school have been living with their wonders since the day they were born. These are the ones we should be talking to, that we should be bringing into Amateur Radio to develop the networks of tomorrow. With their help we could put Amateur Radio back on the cutting edge of technology rather than the trailing edge we seem to be holding on to right now.

Comments? I'm interested in hearing what people have to say. You can please direct any flames to /dev/null--I don't want to hear them.

There seems to be very little packet activity in this area (Phoenix) on 440 MHZ. Around our club, we were kicking around the idea of putting up a small BBS or something, just to get our hands into the packet arena. The idea kept evolving until we found ourselves talking about putting up a full blown repeater for digital use (we already have voice repeaters.) We think we can scrounge up the necessary radio equipment, and are continuing thinking along these lines.

So, with setting up a repeater as the goal, what do we need to do to make a deluxe installation? I see operation at 9600 baud as a possibility, even though I (nor nobody I know) does 9600 at the present time. We would probably be setting a precedent for the area on 440, and thus should do the job well.

There appears to be a bit-regenerator kit from TAPR, but I am not networked well with that organization yet (new member.) Is this the way to go, or is there some other option to consider? Anyway, fire away, and we'll see what we can come up with.

Note that the Cardinal board isn't ASP based, but instead has a real
DSP onboard, an Analog Devices 2115. I have no idea if any ham software
has been written for it, but Analog is supposed to release an SDK for
the Cardinal and the other PSA-based soundcards (ie Orchid Soundwave,
MediaMagic, Adaptec, etc.) Real Soon Now... which means I thought it
was supposed to be out a couple of weeks ago, but seems to have been
postponed a little bit. If you're interested, the official announcement
should be on comp.dsp sometime soon.

Hmm... that is a pretty good price on the card, though. Might have to
pick on of 'em up myself.

(ps - I'm not a ham... yet. just another interested bystander.)

What I did originally post was a short note concering the use of any
generic comm program to access an alphanumeric pager.

A short recap of this follows:

Obtain the paging terminal access telephone no from the pager co. This
is the number you must have regardless of the access software you use.

Set your comm program to 1200 bps N81 at first. If this does not work
use 300 bps. These terminals are not speed demons.

When the terminal answers it will ask for password. In my experience
this is just the name of the paging co. or some variant. (e.g. McCaw
Communications is "MCCAW")

Next you will be queried for the number of the pager. Enter the telephone number of pager -just 7 digits, no area code.

Then just enter the text of your message, usually 80 chars max.

That's all there is to it... If you are so inclined a 'script' could be written that would enter all the preamble stuff automatically.

TCPIP is already available with the KA9Q NOS code (there's lots of books eg NOS INTRO, thru ARRL, to helpyou on your way). There is a problem that there's no one to talk to. The real problem is that increased data rate requires a wider IF and AF section in the T/X. The current voice grade audio that comes through ham FM rigs is only good to about 2400 baud (others probably have better estimates). If you want 56kb, then you need a whole new TX, basically an RF modem. To talk at ethernet rates (10MHz) you are going to have to put all your rigs on 10Ghz. It's a lot of money to invest in a system which is hobbled by every message having to be read by a human at the point of entry.

A friend and I bought 3 of these boards several months ago they were such a "bargain" (about $120).

We had so many problems with software and drivers and installation, we sent them back! Cardinal Tech Support was useless.

Sometimes you get what you pay for!

Anyone need the Wavetable Chip for this Board??

I'm aware that TCP/IP is already available. But this is a suite of
programs which operate only through packet, if I'm not mistaken. Ideally,
any program which can run through standard TCP/IP should be able to run
through a packet-radio version of TCP/IP. As far as I know, this is not
currently the case. If I'm using a Macintosh, for example, and want to
use TCP/IP I *ought* to be able to use NCSA telnet, ditto for Windoze,
standard telnet should work for me on a Linux box, and the DOS version
of it should work on a DOS box. Understand what I'm saying?
And who said anything about Ethernet rates? Seems to me that
a lot of people run SLIP at 9600 baud and don't have many problems. Heck,
I've even heard the rumour that all of Iceland is linked to the rest of
the Internet through a single 9600 baud SLIP link. Similar performance
should be possible via packet (I mean, if LANs can do it, why can't we?).

A packet network should be treatable as a WAN.

I've also been thinking some more about some applications for Packet.
Why don't we use a Client-Server architecture for our BBS's? It's much
more efficient both in the use of the frequency and in the use of the
host computer.
Why not write distributed BBS's, where multiple computers at
different sites share the loads? This is an offshoot of the client-
server architecture.
There are so many possibilities!

1699. GRINOS AND ETHERNET

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-02 12:02:33 UTC
From: kbonne@nx.rtt.rtt.BE
Message-ID:
<"940602.14:00:42*.G=KRISTOFF.S=BONNE.OU=PIRESSYS.O=BELGACOM.PRMD=RTTIPC.ADMD=RTT.C=BE."@MHS>
Source record: 48988

Greetings to All.

First of all, this is my first time a write a message in this (actually any)
mailing-list. So, please forgive me if I do something wrong. ;-)

I've put NOS on a PC at my qrl to do some tests on the LAN.

Some specifics:
- 486 DX 50 PC, 12 Meg RAM.
- Ethernet-card 3c503.
- NOS 2.0m (version PA0GRI)
- packet-driver for 3c503, version 11.6.3. (as part of FTP's PC/TCP software)

This system appears to work all-right but I get this problem:
When I send/receive 'a lot' of data ('a lot' being some hundred bytes), the
session hangs. (the rest of NOS still works OK?)

Anybody any idea?

Boy, that would be nice! I've got a PCMCIA modem in my IBM 755 Thinkpad:
a 14,400 Megahertz, which is really slick. Now if only AEA would come
out with a PK232 version on a PCMCIA card!

You're mistaken. The KA9Q NOS varients will drive ethernet, slip, ppp,
or packet, and route between the various physical channels.

>any program which can run through standard TCP/IP should be able to run
>through a packet-radio version of TCP/IP. As far as I know, this is not
>currently the case. If I'm using a Macintosh, for example, and want to

>standard telnet should work for me on a Linux box, and the DOS version
>of it should work on a DOS box. Understand what I'm saying?

There are problems on the packet side with using these protocol stacks
directly to radio. First, of course, they have no AX25 encapsulation
drivers, and second their TCP timers are defaulted to such low values
that you experience a "packet storm" on the low speed packet channel
as they retry too quickly. They eventually adapt, but meanwhile you
spew a lot of unnecessary retries onto the packet channel. The way
to solve this problem is to use a KA9Q box as a bridge to the packet
network. Talk to it over ethernet, and let it route out onto the
packet network. Works good, we've been doing it for years. With the
proper driver parameters, you can limit the packet storm to one long
AX25 packet at the beginning of a session.

> And who said anything about Ethernet rates? Seems to me that
>a lot of people run SLIP at 9600 baud and don't have many problems. Heck,
>I've even heard the rumour that all of Iceland is linked to the rest of
>the Internet through a single 9600 baud SLIP link. Similar performance

>should be possible via packet (I mean, if LANs can do it, why can't we?).
>A packet network should be treatable as a WAN.

Right, we do. 9600 baud half duplex packet really isn't comparable to
a 9600 baud duplex SLIP link though. The channel is contending, and
turnaround delays reduce throughput remarkably. The performance of
9600 on a contending channel is more akin to 1200 baud on a telephone
line. You really have to go up to 56 kb to get snappy performance.

>I've also been thinking some more about some applications for Packet.
>Why don't we use a Client-Server architecture for our BBS's? It's much
>more efficient both in the use of the frequency and in the use of the
>host computer.

A wonderful idea. I've been pushing this idea for a while in a somewhat
modified form. Instead of traditional SQL type transactions, packet is
better suited to the use of intelligent agents. Automatically written
in a compact interpreted form, similar to Forth, by your query software,
the agent is dispatched to find information you seek on the packet network.
As it arrives at each participating node, it executes on an interpreter in
that host and does it's queries. If it finds the desired info, it mails it
back to you and deletes itself. If it doesn't find the info, it mails
itself to the next node and continues the search. This approach is
better suited to the limited bandwidth of packet than the traditional
client-server architecture.

> Why not write distributed BBS's, where multiple computers at
>different sites share the loads? This is an offshoot of the client-
>server architecture.

An approach better suited to the broadcast nature of the packet channel
is to setup a BBS using the AMSAT broadcast protocol. When a station
requests a file, all other stations on channel copy along. If their
operator also wants the file, only fill requests for missed frames are
required. It's a much more efficient way to share the limited packet
channel resource. Note: broadcast servers should really be on a separate
channel from normal chat activities unless the channel is high rate,
such as 56 kb.

>fire away, and we'll see what we can come up with.

I don't think bit regenerators really add much utility to packet repeaters. If a station is so noisy into the repeater that bit regeneration will help, it's likely that the station is receiving the repeater so poorly that it will consistently lose packets as well. That assumes the repeater is well balanced and isn't an alligator. Ideally the repeater should serve only as a bent pipe to extend coverage. It shouldn't do any processing of it's own. It should attempt to reproduce as linearly as possible what it hears on it's input. That way, stations with problems will have those problems clearly audible to other users on the channel who can then give the station feedback on it's problems so that they can be corrected. It's terribly frustrating to have the repeater continue to spew out damaged packets and not know why, or even who the offending station is.

But it does. For example, VersaTERM and VersaTERM Pro for the Mac work
as a client with a slip link (or modem dialer) to a KA9Q NOS box.
Cameleon software in windows for the PC works with some of the newer
versions of JNOS and those debugged by Doug Crompton.

That's the real advantage of TCP/IP it was specifically ported over to
amateur radio by Phil to comply with the "real world". Not to do the
(apparently normal for hams) close but different method. (Such as
Lotus Cc:Mail and the rest of the mail network.)

I am a ham from Hong Kong (VS6/VR2). My callsign is VR2YJR.
I am a member of Hongkong Radio Tranmitting Soceity (HARTS). Our Society
request members to vote for pay for satillate access of local BBS to fast
exchanging of message from Hong Kong to all over the world.

Our Society is very small and we need to pay more than half of our
money. I want to ask that is it possible to exchange messages from Hong kong's
packet BBS to the world via Internet to packet gateway rather than satillate ?

Would you give me some information about this to me ?

Please reply via email to ee_hflo@uxmail.ust.hk

[some stuff deleted to save bandwidth]

Doug actually has a VERY good point here, in that the KA9Q and related
TCP/IP packages provide TOO MUCH. At this point, there are several
very good implementations of TCP/IP available for most EVERY current
computer. Why replace all that with NOS? With some work, it might
be possible to write a DataLink layer to run under a commercial

IP implementation that would allow all kinds of nice IP based apps
(Trumpet for Windows, for example) running over IP on radio.

Actually, the solution, as I see it, is to modify the 8250slip.com (or whatever they call it nowadays) so that it operates with KISS rather than slip. KA9Q does a fine job, true, but it is an application and not a driver. A driver would run invisibly to msdos (until, of course, and application such as pop-mail needs some network traffic.) This sort of modification would be most benneficial to Hamdom, as 'Joe Ham' would have a 'simple' package in which to communicate.

1707. KA9Q-NOS, JNOS, WNOS, and GRINOS - Which one to use?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-02 17:24:44 UTC
From: zawodny@arbd0.larc.nasa.gov
Message-ID: <2sl4ks$42n@reznor.larc.nasa.gov>
Source record: 48895

I am just getting started in TCPIP (I've just about given up on "regular old vanilla-flavored packet") via packet radio and I see all these refernces to KA9Q, NOS, JNOS, WNOS, GRINOS, and maybe others. I have the 920603 version of NOS by KA9Q and I am wondering if any of the others are better (totally subjective concept). I have found various sets of source code for some of the others, but I do not have a C compiler on my PC.

Ideally I'd like to run TCPIP (telnet, NFS, and FTP, and an NNTP reader) concurrently via both my ethernet-card-10BaseT-LAN and SLIP-KISS-paketradio.

I will soon be switching to Windows-NT (or Windows 4.0 when that comes out) so, comments on compatibility with these OS's are also welcomed.

My questions are these:
Is there a FAQ which describes the different flavors of NOS?
Have there been major improvements or bug-fixes to the e920603.zip file I downloaded from a SIMTEl mirror site?
Most importantly, where can I get compiled binaries for the other NOS's?

Someone in the UK did some experiments and found that 3600 baud goes
through most ordinary voice grade radios. They then designed a 3400 baud
modem based on a standard modem chip run off a strange xtal freq!

I'd be interested in one as well. I guess that something like a Baycom modem would be fairly easy to do. After all you'd be fairly safe in assuming that the box the modem was plugged in to would be capable of running software to drive the modem.

Anyone know if there is such a thing as a PCMCIA development/prototyping kit that allows you to build your own add-ons ?

: So, with setting up a repeater as the goal, what do we need to do
: to make a deluxe installation? I see operation at 9600 baud as
: a possibility, even though I (nor nobody I know) does 9600 at
: the present time. We would probably be setting a precedent for
: the area on 440, and thus should do the job well.

: There appears to be a bit-regenerator kit from TAPR, but I am not
: networked well with that organization yet (new member.) Is this
: the way to go, or is there some other option to consider? Anyway,
: fire away, and we'll see what we can come up with.

: -dave

From our experiences on 9600 in the greater Seattle area, I'd say that the TAPR modem with the bit-regen option is the way to do a 9600 baud lan - especially if you serve any kind of wide area. We currently have 4 of these systems implemented, one on 2 meters, and 3 on 440 MHz. The plusses are the much improved throughput at 9600, and that there are no hidden transmitters when a repeater is used. The latter concept has been demonstrated here for about 8 years with a 220 MHz repeater - originally no special circuitry - just a voice-capable repeater with a TNC for an id'er and set up for rapid keyup. Another area of benifit is especially important at 9600 - all stations can use beams and aim them at the repeater. 9600 operation is more affected by multipath than 1200 baud, so anything that you can do to make the path rock solid makes things work a >lot< better. Right now I am not aware of a PC board containing bit regeneration capabilites for a 1200 baud modem. Oh - here's another plus - all stations using the repeater appear to hear eachother direct. No networking intellegence is needed at the repeater site. All users connect 'direct'. Network links can also be done off-site - they just look like another user to the repeater. Hope that sells you on the repeater concept - we use it to very good effect here!

I'm interested in getting either an AEA 2232 or DSP-12 for use as a multimode controller. It would see service primarily for satellite use but the potential of some HF as well. I've also heard of a TAPR unit (kit?) that is soon to be released.. Anyone who can give me details, opinions, suggestions, etc. would really be helping out a new ham. I can be reached at lurker@umich.edu
Thanks!

1713. Ethernet address Directory?

The proper approach, as I see it, is to use a minimal NOS to act solely as a protocol converter between packet radio and the household ethernet.

You can then use your Mac, X-terminal, BSDI, Sun, SGI, or whatever else you want to do packet.

The mistake is in thinking that NOS is all there is, and that you have to be at the console. NOS doesn't even need to have a console, and you don't have to be there.

A simple 286 (what, $59 for the motherboard?) running with just a floppy is sufficient. Add a DRSI card, or a PI card, or a PackeTwin card, or even a serial card running KISS to a TNC, and you're up.

Ideally,any program which can run through standard TCP/IP should be able
> to run through a packet-radio version of TCP/IP. As far as I know,
this > is not currently the case.

I've made the same comment to some of the TCP/IP fanatics in this area.
They seem to be happy with the various flavours of NOS/NET that exist.
I'd like to add some 'features' to NOS, but I get put off by having to
try and figure out what the impact of my changes will be on the 350 (ish)
source code files that comprise JNOS (for example). What I'd ideally
like is a TCP/IP stack as a TSR that can have one or many hardware
drivers plugged into the bottom end and then present a standard API to
the programming world. Then standard telnet, etc could be used on top of
the TSR and I could write software using the API without having to worry
about messing up any of the underlying code. One possibility that could
be used, although I've not explored it, is some of the Winsock software.
Unfortunately that means learning to write sensible Windows programs :-(
I'm talking 'IBM PC world' here, but the same could easily apply to other
environments.

> And who said anything about Ethernet rates? Seems to me that
> a lot of people run SLIP at 9600 baud and don't have many problems.
A slip link is a bit different to a packet link...it's a true full-duplex
link which doesn't have to contend with weak signals from remote areas
causing problems and also doesn't have to put up with the vagaries of how
people set up their packet gear. I know 9k6 can be implemented, but it's
not that easy. I've only had one dabble with it so far...I had my end
working on the bench, but on air it locked up. The guy at the remote end
couldn't even get his end running! The local gurus didn't seem to know
the answer, so now the gear is sat here waiting for the next brainwave
about why it doesn't work!

> I've also been thinking some more about some applications for Packet.
> Why don't we use a Client-Server architecture for our BBS's? It's much
> more efficient both in the use of the frequency and in the use of the
> host computer.

Hmmm...is it more efficient? In some respects the BBS system already is
client-server (it all depends which of the many client server models you
are referring to). The BBS (server) holds the database which is accessed
by the client using various 'L' commands. When using the TPK software
with the F6FBB BBS software, the BBS doesn't format the message lists,
that is done by the TPK client running on the remote PC. Client-server
is not necessarily the utopian answer to our dreams, although there are

ways in which it could help us. Indeed, it can only be a partial solution whilst there are still people running dumb terminals or machines that don't have the relevant software available for them.

> Why not write distributed BBS's, where multiple computers at
> different sites share the loads? This is an offshoot of the client-
> server architecture.

That is one possible solution, but it does rather rely on having decent high speed network links to the distributed BBSs. Your original comments were that your local network isn't too good...that IMO suggests that a distributed BBS service in your area would be doomed to failure from day one.

1717. Re: need repeater advice

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-02 20:15:18 UTC
From: brian@nothing.ucsd.edu
Message-ID: <2slekm$7na@network.ucsd.edu>
Source record: 48900

The one (and perhaps ONLY) advantage to using aa bit-regenerator in the repeater is that it prevents the repeater from being taken over by 1200 bps and voice users.

If you are willing to put up with the longer keyup delay of using the DCD circuit in a 9600 bps modem instead of fast carrier squelch, you won't need the bit regen to keep the scum off, since only 9600 bps transmissions will key the repeater.

It's an area engineering decision, I think.

OK, that's a solution, but hardly one for the average packet user! I doubt if most packet users have one PC at this time, never mind two of them.

> An approach better suited to the broadcast nature of the packet channel
> is to setup a BBS using the AMSAT broadcast protocol.
I'm glad that I'm not the only one to be thinking such things! Trouble is that until there is some software available to do it most users/sysops won't even think about it. This is actually the main reason that I wanteds to get into modifying NOS...I wanted to use it for broadcast purposes. As most of the low level code is available to dump out data onto the relevant hardware I thought it would be fairly simple to add some code to look after the broadcast/missing packet handling. It's just a pity that NOS is sooo big...200+ source code files for JNOS and a horrible feeling that the code you're writing is going to clash with something hidden away in a deep, dank corner of the software :(

Doug,

THere is nothing wrong with using an OS's native IP stack for Amamteur TCPIP. You
just need someone to write the correct driver/software. I believe Linux has this now.

As far as client/server, alot of people will balk at this, becase this is a big change in
the culture.
Look how long it's taken folks to get to 9600 baud packet.

>such as 56 kb.

Sounds like what I've been talking about for use with such things
conferences and DX-cluster. Nothing can suck a channel down to
nothing faster than 6 people on a conference and one of them being
marginal at best.

The only real problem is that the broadcast protocol would have to
supported at the TNC level because there are just too many people
out there with just a TNC and dumb terminal (dumb terminal also
refers to a PC running a terminal program). As suggested, perhaps
certain cahnnels could be setup for broadcast protocol use but you
know how well that will work when we can't even keep individual
users from jumping onto a trunking frequency.

I saw a post suggesting that you upgrade to ncurses1.8.5.

If that doesn't cure the problem, you probably need to look at a cross
reference map to see where the undefined symbol is referenced (an more
importantly, where it should be defined)

Clues on how one can set this up would be appreciated.

I've never been able to get NOS running, at least not for more
than a couple hours in a row. Have tried NOS, WNOS, JNOS (and probably
others that I've forgotten). Gave up on them fairly quickly once
they were running, as there is nobody to connect with.

Now have ethernet between the various computers, and sure would
like to have the ham radio network available on all the machines.
Doing it now via BPQ over ethernet, which works ok, but would much
rather be able to do what Brian describes.

How would one setup such a system?
Give us some details ...

... Hank

```
: Doug actually has a VERY good point here, in that the KA9Q and related
: TCP/IP packages provide TOO MUCH. At this point, there are several
: very good implementations of TCP/IP available for most EVERY current
: computer. Why replace all that with NOS? With some work, it might
: be possible to write a DataLink layer to run under a commercial
: IP implementation that would allow all kinds of nice IP based apps
: (Trumpet for Windows, for example) running over IP on radio.
: ---------------------------------------------------------------
: Daniel Senie Internet: dts@world.std.com

In the ethernet world, there is a standard for a "packet driver"
which presents a constant interface to applications above it
which want to use the ethernet. There are packet drivers for
every brand of ethernet card. DOes anyone think it's possible to
write a packet driver which would provide the same interface
to a tnc in KISS? That would let you use all the apps people
have mentioned here, like NCSA Telnet, Trumpet, ect.

Just a thought...
Regards,
Chris

1729. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-03 03:00:06 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_770612404@ve6mgs.ampr.ab.ca>
Source record: 48928
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

> a 14,400 Megahertz, which is really slick. Now if only AEA would come
^^^^^^^^^^^^^^^^

WOW!! forget the packet modem!! Keep that 14.4 GigaHertz modem!!
How many miles can you go with that?
Is there a dish antenna on the side of it?
Do you have any trouble keeping it pointed to the receiving party while
you type?
It it enough watts to cook your eggs in the mourning? 8->

NOTE: Smilies all around!!

Chuck
N3QAT

p.s. Seriously though why not just use a baycom type model in a db25
shell? Now that is small. You could use surface mount componets and
probably get it into a db9 shell.

does the motorola "engine" actually provide the necessary pseudo-range data
as output, and can it accept pseudo-range as input (for it's solutions)?
if so, i would be interested in having a pair myself ...

>DGPS has nothing to do with "large bodies of water" as the original poster
>implied. There are installations around the Great Lakes that broadcast
>dgps data, but that is only an instance of using dgps. DGPS is implemented
>by placing a unit at a precisely known location and subtracting that
>precisely known lat and lon from the data received by the dithered gps
>unit. Those differences are then broadcast. If you use those diffs to
>correct the reading from another gps unit, you have effectively removed
>the dither on the signal. That is what I will do with my portable gps
>unit and the one at the repeater site.

not exactly. you can implement a rudimentary system along these lines,
but the increase in accuracy isn't as great as you would get if you
broadcast pseudo-range corrections (derived from a receiver at a known
location) and this data is incorporated into the solutions that mobile
receivers make.

not that you shouldn't try a simple delta-lat/lon setup for starters.
however, i would recommend a packet arrangement tho. 1200bps packet
equipment is cheap, easy to come by, easy to connect, and you can probably
go into a store and buy all the needed goo (if you lack it) to begin
experiments promptly. send the stuff in unnumbered I-frames, addressed
to "DGPS" say.

hm ... this could actually be a pretty darn useful service.

Each vendor has a whole BLOCK of ethernet addresses. So, each card they make can have a different address. These blocks are listed in an RFC, but I don't remember which one. And, for new ones, or those that don't seem to be listed, you can call the IEEE and ask them. They might not tell you who the vendor is, but they can have a vendor rep call you back if you need to identify some wayward ethernet address.

In other words, what you are suggesting is a beast known as a ROUTER!
A low-end router with a decent TCP/IP stack and an async driver to
handle KISS interface to AX.25 would do the trick. I've been thinking
about experimenting with such an approach. Essentially what you'd wind
up with could be thought of by hams as an Ethernet-attached, TCP/IP
TNC...

It sounds like what you folks are really talking about is MULTICAST traffic, which is somewhat different from BROADCAST. Whether the protocol is supported by the TNC or not depends on whether you implement over AX.25 or not. An extension to AX.25 to add new frame types would have unpredictable results on existing TNCs (theoretically they could just drop them, but it's unclear if the TNC firmware in everyone's TNCs is able to do that). Alternatively another protocol, such as TCP/IP could be used. Internet standards cover things like multicast...

Yeah, what he said. And for NDIS as well... (NDIS is microsoft's
equivalent to the "packet" drivers).

The commercial TCP/IP stacks support things like the WinSock interface,
which allows applications under MS Windows to communicate using a
standardized interface over TCP/IP networks.

That sounds like a great idea. If anyone finds any information
about it, let us know. I saw an ad in QST for software to
receive WEFAX, and SSTV using the SB, but only B&W SSTV. Now
if this is possible, why couldn't it be possible to make the
same for RTTY, Packet, etc. and TX of SSTV. Seems simple
enough if you know what you're doing...

Talking KISS is not the answer, there is already a packet driver that can do that. What you have to have is the entire AX25 set embedded in the driver so that it can enclose the IP packets in an AX25 envelope and then enclose *that* in a KISS envelope for delivery to the KISS TNC. An AX25 driver is not something that can easily be made a TSR. It has to maintain state, it has to have various timers running, and it has to do link level address resolution via the arp agent. That's difficult to do on a single threaded operating system like DOS where preemptive multitasking isn't native.

There *is* a kernel mode AX25 driver for Linux, and one that runs in user space for Sys V Unix. IMHO, if you want kernel level support features, you need to run a proper operating system that's designed to support such features. Linux is one that will run on a PC. DOS is a glorified program loader, no amount of kludges and bandaids (such as Windoze) can fix that. NOS is an attempt to bring multi-threading to the DOS world. It works, but requires any added application be compiled in. That's not ideal, but it's about the best you can expect from a system hampered by DOS.

Gary

Agreed, and it's why I'm not likely to get a ham license. If amateur packet
radio could really be part of the internet, then I'd be first in line for a
ticket - code or no-code.

It's not much to ask. A $59 286 motherboard, a $40 case and power supply, a $59 floppy drive and controller card, a $110 Ottawa PI card, and a $75 ethernet card, and you're set for speeds up to 56 kb. Comes to $343, about what a PK232MBX costs, and you don't need the PK232 and it's straitjacket limitations. You've got a totally open system to which you have the *source code*. Or, you can go down to the local surplus place that's selling pallets of PS/2 Mod 30s for $65 with keyboards (you can use the keyboard for something else). Drop in the ethernet card, and stick a Baycom module on the serial port, load the Baycom packet driver and NOS, and you're set again, but this time for only $165. That's the cost of a PacComm Tiny 2, and you don't need the Tiny 2. PCs are so cheap, and so much more powerful than a little Z80 dedicated board, that there's no reason to have a TNC. Dedicate a PC instead.

The user programs to work with the Microsat broadcast protocol BBSs are available turnkey from AMSAT, windows, pull down menus, all that user crap, already done. I think it's a $10 donation, I got mine when I renewed my membership. The BBS software itself runs on a V40 system very similar to a PC architecture. I think the code was actually developed on a PC. We should be able to shake it loose from the authors and put a jazzy sysop face on it for Joe BBS operator.

It's not really spaghetti code. It's fairly well modularized, that's why there are so many source files, and it's fairly straightforward to add features. I have, and I'm no programming whiz. It does take a while to understand how the whole system hangs together and how the different modules communicate. The reason NOS is so big is that there's no real underlying operating system to call upon for services, just a program loader called DOS. NOS is a multitasking OS with an embedded TCP/IP stack, the AX25 link layer, a KISS driver, ethernet driver, SLIP driver, PPP driver, etc, along with any applications such as ftp, telnet, smtp, BBS, etc.

Unfortunately NOS is a lightweight multitasker that can't handle external programs. If it did, it would be twice as big, and worth real commercial money. Fortunately, there is an alternative, it's called Linux, and there is a kernel mode TCP/IP stack and an AX25 driver available for it. It's available *with source* on CDROM for a few dollars. There's no excuse to still be hobbling along with DOS and Windoze when there's a real operating system available for practically free that has all the features you're asking for, and more, including the complete Gnu C development environment.

>TNC...

You've almost got it. The only point on which you seem confused is
the role and location of AX25. A TNC in KISS mode doesn't know from
AX25. It's just a stupid modem with just enough smarts to not transmit
if the channel is busy. The AX25 layer happens inside NOS *before*
the KISS encapsulation driver. Let me try to illustrate with the
OSI stack.

Application layer (smtp, ftp, telnet, etc)
Session layer (part of the NOS task switcher)
Transport layer (TCP)
Network layer (IP)
Upper link layer (AX25)
Lower link layer (KISS)
Physical layer (pretty dumb modem hardware)

I skipped the presentation layer since it's null in most flavors
of NOS. And I split the link layer to show the relationship of
AX25 and KISS. KISS isn't necessary if you have an internal packet
card such as the Gracillis, PI, DRSI, etc. KISS is only needed if
you're talking to a stupid TNC over a *serial* link. If you use one
of the internal cards, you can use one of the card specific drivers
in NOS as the lower link layer, or you can use a packet driver TSR.
Each IP packet fits inside an AX25 envelope, and each AX25 frame
nests inside a KISS frame for the link between the PC and the TNC,
if used. ***KISS FRAMES ARE NEVER TRANSMITTED*** They're just a way
of getting the AX25 frame out to the modem where the AX25 frame is
transmitted.

(Note there's fragmentation to consider in the above model that I
haven't shown, so it isn't quite this simple, but this is the general
flow.)

Exactly. I believe NOS will do this just fine. As Brian pointed out, a low-end PC running NOS should handle it. An ethernet port, an async KISS port, and a few lines of config file and you're in business. I've been thinking of setting up such a network at home. All I need is a 9600bps TNC and a round tuit.

Having worked (struggled?) with lots of TCP/IP networking packages over the last few years, I'm very impressed with NOS. It's better than lots of commercial products and you sure can't beat the price.

>could be used. Internet standards cover things like multicast...

(Ok, this is a very oversimplified explanation of how this system
works. It's correct in spirit even if the details aren't exactly
the way it's done.)

The AMSAT broadcast protocol uses unmodified AX25 UI frames as it's
carrier. Nested inside each AX25 frame, just like IP packets nest
inside AX25 frames, is a Pacsat protocol packet. This packet has
a header that identifies the file being transmitted, and the chunk
number of the portion of the file in this particular packet. These
chunk numbers are consecutive ascending values. Each station on
the channel copies every AX25 frame it hears and looks inside for
the Pacsat header. If the header says it contains part of a file
the user has selected (usually users select all files as default),
the chunk number is examined. If it's a number that hasn't already
been captured, the following data is stored to disk. The pacsat
server periodically broadcasts a directory listing which includes
the size of each file. Using this, a station can determine when
it has collected a complete file and stop looking at any further
Pacsat packets with that file name in the header. If some frames
are missing in the sequence, the station can request fills from
the server. That request is put in the transmission queue and
sent when channel time is available. After all outstanding file
and fill requests have been filled, the server goes quiet except
for periodic broadcasts of it's directory.

The idea behind this system is that a file should only have to
be transmitted once for all stations to get a copy. The various
details are so that stations who miss part of a file or files
can get them at a later time. For this scheme to be efficient,
most stations have to continously monitor the channel, and file
requests should occur on a separate back channel. Only the
server should transmit on the main output channel to avoid losses
due to collisions. Think of it like a repeater except that instead
of repeating your packets the server services your requests for

packets. (You can do it simplex, but there will be more fill requests.)
Johnny Come Lately stations can come on and request a file that's
already been sent. That causes information that's redundant to most
stations to be sent, but it's still better than having *every* station
request the files one at a time and having n copies of the file
transmitted.

Gary

Steve, I just don't see what the value of having Ham radio be part of
internet. Internet is already there and it has specific missions.
What is the sense of turning amateur radio sites into internet nodes.
There are plenty of better and more efficient ways to tie into the
internet. If all you want to do is save money, then that is not
the purpose of Ham radio.

While I can appreciate the BBS services of packet. I have to question
this as a main purpose in amateur radio. I'd like to see packet
turn into a more real time "communications" avenue. Logging into a
mail box isn't really radio.

Ach, I understand now. Please forgive my ignorant accusations. My
primary experience has been with the Mac version which doesn't seem
to me to work thataway, nearly as I can tell. 'Course, that could be
my natural confusion (and desire to scream) at a PC program which has
been directly ported to the Mac speaking. :-)

>(Trumpet for Windows, for example) running over IP on radio.

EXACTLY my point! I should be able to write a TCP/IP program intended
for use on either the Internet or a packet radio internet and not have
to worry about any differences between them. As I said, the concept of
a UNIX device driver is handy here...one could be written so that even
an individual TNC capible of handling multiple channels could handle
multiple connections...to functionally be different devices even though
everything gets routed through the same device.
I've heard rumours that JNOS works this way, but nothing con-
firmed. Not to mention the fact that I don't happen to have either a
DOS or UNIX box handy to test it out on. Can anybody confirm or deny?

The best computer systems I have seen for RFI filtering and low subseptability are those made by Apple computer. The Macintosh line is extremely RFI quiet, and the interface pins are filtered with appropriate EMI filtering. All cables are shielded, and the "toaster" varieties (Plus, SE, Classic, Classic II, Color Classic) have the advantage of filtering the monitor.

The only problem I've encountered is with ADB keyboards, who generate a teeny bit of hash on 10m. Better antenna separation would probably eliminate that. (The leakage is THROUGH the keyboard, not the cable or case - kinda hard to eliminate)

For even better RFI supression, I suggest the PowerBook line of notebook computers. I have yet to hear a peep out of my PowerBook 100 on any band.

Hello,

I'm looking for someone who might be able to help me get started with TCP/IP over packet. I think I have everything I need; a TNC, a radio, a computer, an IP address, and software. I have tried several times in the past, but I never seem to have any luck getting anything to work. Some questions are:
- What software to use? There seem to be about a dozen implementations of TCP/IP for packet, each with about a dozen versions. How do I know what to use?
- How to configure it? I get the impression that my configuration needs to match that of the people I communicate with. Things like which mail service is used, that kind of stuff.
- How do I know if it's working? I tried monitoring the data, and I can see packets going back and forth between the various stations. But if I try to 'ping' or 'ftp' or 'telnet' to any of them I get no response. Is this a radio issue (are they not hearing me?) Do I have something configured wrong? Are their stations just ignoring my packets?

If someone has time to help me get this thing going, I'd appreciate it.

Thanks,
Chris Moore

Something like a simple "home router", with an ethernet connection on
one side, and AX.25 and/or SLIP on the other. Ethernet chip and an embedded
286 should do just find. Should run in the $250 neighborhood.

A very good thought too...and one that I'd been wondering about myself recently. We'd need quite a few different versions though...a serial link into a TNC is just one way to get packet out of a PC. I wonder if anyone will rise to the bait. I'd consider it, but work is getting hectic at the moment...plus my assembler ain't what it used to be :(

Hello.

I would like to receive some information about the regulations for work of automatic packet stations (BBS, gateways, TCP/IP stations etc.) in your country.

I'm asking for such an information, because I was asked to participate in a commission of our radio amateur society (PZK), which will prepare a proposal of such a regulations. Till now there are no special regulations for this kind of stations, but the authorities want to creat a speciall category of licence for them. Because we have heard that their project is full of restrictions, the PZK has taken the initiative and will prepare a proposal.

Please help me prepare to my work on that subject by letting me know how these regulations look like in your conutry. All help appreciated.

HEAR, HEAR!

I keep seeing simplex frequencies being allocated for packet yet packet remains darn near unusable because of the hidden node problem. In the LA area, there is a faction trying to implement "the cellular approach" by making all the nodes low power, serving a finite small area and getting people to use the closest mode while the nodes are linked via high speed whatever. Guess what. All you do is reduce the area but still haven't done anything to cure the hidden node problem. The cellular people are quick to point out that cellular works for the phone company so it should work for us. They forget that there is only one person on a frequency in a cell and the cell site controls his transmitter power to level where communication is reliable (more or less) and certainly won't cause interference to whatever cell might be reusing the frequency. Hams being what they are will always try to talk to that node on the other side of town, negelecting the one which is local to him. A good distributed duplex repeater system will far outstrip the cellular system any day. I'm not a betting man but I'd be willing to lay odds that 5 duplex repeaters could handle a heck of alot more traffic than 10 simplex channels can.

I see know no reason why a computer filter with a carefully
selected mask to sidetrack messages with certain words, etc.,
for human inspection would not satisfy the regs.

1764. Good TNC for AX.25 over HF and VHF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-04 01:12:11 UTC
From: brad@cerberus.bhpese.oz.au
Message-ID: <1994Jun4.011211.17668@cerberus.bhpese.oz.au>
Source record: 48849

Can somebody recommend a good quality TNC that will support KISS mode AX.25?
Initially I will be using it over HF, but likely to move to VHF in the
future.

The models I have been recommended by salesmen have been the AEA PK90,
the MFJ1274 and the MFJ1276.
One salesman recommended that the Kantronics KPC-3 would not be as
suitable as its receivers were not as sensitive as the MFJ1274C,
and this could lead to tuning problems. Is this true?

Can anybody provide me with a recommendation of which TNC would best suit
my requirements, and what the basic differences are between the three TNC's
that I have been recommended?

Thanks,

What door is necessary to drop to packet radio from a LLBBS? I have doorway and tried using PP88 software but although it works in local mode when a user tries to drop down his screen is blank. I suspect that the pp88 is using graphics and wont pass through the door. I have hrd that some BBs's have this feature. Are they using a more generic packet program (ascii only) or is thr a better door? Thanks.

>this model, or if major mods are required.
>
Basic principle for all xtal rigs is as follows:

For the RX: find the discriminator output (before any audio filters) and
take a feed from there

For the TX: put a varactor across the xtal with a bias circuit and
inject the signal from the modem into it. I knocked up a simple circuit
with a dual op-amp and a voltage reference to level-shift the signal to
what I needed for the varactor.

Some TX may actually have the varactor in place, but most seem to use a
phase modulator after the xtal oscillator so you will have to fit one.
You will need to determine the varactor capacitance swing needed for
your particular rig. Basically, you need to be able to pull the xtal far
enough either side of centre to give a signal approx 20kHz wide at your
transmit frequency.

Subject: C50 DSK Status
To: ham-digital@ucsd.edu

Texas Inst. is now accpeting orders for the C50 version of the DSK.
It "hit the street" on 5/1. The price is $99.95, the same as the C26
version.

The code from a C26 will probably not run on a C50 version. The port
should be easy, so we can hope HB9JNX and KC7WW will have access to
a C50 and will provide us with new versions.

Subject: DSP4 Update
To: ham-digital@ucsd.edu

Dear friend,

Here is some information about the DSP Card4 project and how to get a board.

Background:

The DSP card project has been developed by Jarkko Vuori (oh2lns) and
Kaj Wiik (oh6eh) as a part of their studies and radio amateur / satellite
/dsp hobbies. There has been also dsp card1...3 before this. The history
is included in the documentation.

During Autumn -93 a batch of 100 boards was made (mainly to
hamradio community worldwide). The 'mass production' was arranged under
the name of local hamradio club RATS r.y. (OH2NXX).

Availability of the DSP Card 4

The circuit board is available via RATS r.y. At this moment there are some
rev 2.3 boards left. New boards will be made during summer -94.

RATS has ordered also a box of the dsp56001's, the confirmed delivery is in
August.

A group order of components was arranged by oh2nxx too.
There was following kits:

PCB: (240 FIM or 40 USD)
Kit1: DSP56001,CS4215, 27MHz XTAL, 24.576 MHz XTAL (800 FIM)
Kit2: All integrated circuits (14 pcs) + XTALs (1100 FIM)
Kit3: All parts to be mounted on the PCB (1700 FIM)

If there is enough interest, new order of components will be made also
later this year.

If you want to buy a board it may be worth of trying to send the money
in a letter, as otherwise you must add 40 FIM for us to purchase a cheque
or similar.

Where to find the latest stuff?

All the new software and the latest documentation is available via Internet
from ftp.funet.fi, directory /pub/ham/dsp/alefn/dsp4. They are also
available from jeeves.hut.fi, directory /alefnull.

There is also ongoing mailing list available where the myriads of DSP CARD 4
technology is discussed:

DSP4 related list: dsp4@lists.funet.fi
Subscribe/unsubscribe with:
To: mailserver@lists.funet.fi
Subject: (whatever, you will see it in server's reply)

SUBScribe DSP4 Your Personal Name
UNSUBscribe DSP4

("SUBS" is shortest form of the command, longer version can be
used too..Commands, and list names are case insensitive. More
info with `HELP' command)

Submission to the list shall be addressed to:
dsp4@lists.funet.fi

If you don't have possibilities mentioned above, limited support can be
obtained by sending a SASE (and diskettes, if needed) to
RATS r.y. PoBox 88, FIN-02151 ESPOO.

Subject: GE Master II Transciever for 9600 Packet?
To: ham-digital@ucsd.edu

Hi Everybody,

The East Atlanta LAN Group is putting up a 9600 bps packet user node for
our LAN. I purchased a GE Master II transciever at Dayton for use as the
RF side of our simplex digipeater on 441.0 MHZ. We plan to move to
duplex operation as soon as we figure out how to set it all up.

Question: Does anyone have any experience using this transciever in this
application? Got any experience you can share to make the task easier?

Tks much,
Steve Diggs KB4ZTN

From: vigra.com!steve@network.ucsd.edu
Subject: PK-232MBX vs. MFJ-1278B
To: ham-digital@ucsd.edu

I went shopping for my first multimode TNC today, and pretty much
narrowed it down to the MFJ-1278B and the AEA PK-232MBX. I'd love to
hear from you net.hams about which you prefer and why. Here's my
comparison based on what I know so far, which is pretty much from
adverts and data sheets. If you have any pointers to reviews that
might help, I'd like to look them up.

I've read the packet FAQ and some other literature, and decided that I
will probably be using the TNC for more receiving than transmitting.
I'd probably have it hooked up to a Unix workstation most of the time,
maybe a DOS machine on occasion. I'd like to experiment with TCP/IP
under FreeBSD as well. I'm also interested in receiving all the
mystery digital broadcast tidbits on shortwave, especially wefax and
other images.

The PK-232MBX claims the following:
$299 at HRO ($399 list)
Rx & Tx: Packet, Baudot and ASCII RTTY, ATOR / SITOR ARQ and FEC,
Morse code, WEFAX, PACTOR, and Gateway.
Rx: NAVTEX/AMTEX and TDM
18K (non-expandable??)
PakMail
17-pole "effective filtering"
SIAM ("for auto RTTY signal ID")
Host Mode

The MFJ-1278B looks like this:
~$299 at HRO ($299 list)
Modes: Color SSTV, Color Fax, "16 Gray Levels Modem", Packet, AMTOR, RTTY,
ASCII, CW, Fax, SST, Navtex
32K RAM (expandable to 128k, 512k)
Contest Memory Keyer
Free AC power supply
"random code generator" (?)

Both have KISS mode, which is important to me, since I like to hack
protocols and TCP/IP stuff. I avoided 9600 baud TNCs, since they
tended to have less modes, and I don't have a 9600-capable radio.
Here are some questions I'm hoping to answer:

What is special about "PakMail(tm)"?
Is the PK-232 fax grayscale or 1-bit B&W?
Is the MFJ fax really full-color, or is it "color shading" instead of gray?
How common are SSTV transmissions?
How valuable is the new "Gateway" mode of the PK?
Do most people find 18k to be adequate RAM?
Are there any features that make one unit significantly better than the other?
Are there any glaring problems with either?

The salesman at the local HRO was *very* pro-PK. He strongly
recommended it over the MFJ. His explanation was that it was a much
better designed TNC, with a lot of support from AEA and amateurs. He
claimed the filtering and reception on the PK-232 was superior to the
MFJ. I don't have any reason not to believe him, but I'll take an
unbiased group opinion from the net over HRO's anyday.

I'll be reading this group carefully, and will post a summary of any
responses I get via e-mail. Thanks in advance!

Your modem cable should work fine. The only issue would be whether
Hostmaster needs hardware handshaking or not. I think it does. If so
you would be best to use a "High speed" modem cable, which just means
it has the hardware handshaking lines in it.

Subject: PacComm Micropower-2 -> Realistic HTX-202?
To: ham-digital@ucsd.edu

Does anybody happen to know the cable configuration to hook the
PacComm Micropower-2 (it's basically the Tiny-2 TNC) to the
Realistic HTX-202? I picked one up cheap, but it was without
any docs (the TNC). I've ordered them, but would sorta like to
get on the air ASAP--dunno when everything'll be coming in. Also,
if you have an online version of the command set, I'd be obliged.

Subject: Packet<->Internet gateways
To: ham-digital@ucsd.edu

Hello, I was wondering if anyone has tried (or preferably has a list)
of the packet to Internet gateways that seem to exist.

On the Internet, telnetting to

af2j.ece.psu.edu
ke9yq.imsa.edu
hpcsos.col.hp.com
and several others, some go up and down!

will give a login. The ke9yq one allows anonymous login and appears to
let to AX.25 and NET/ROM out on amateur packet! (You need to register
to do this.)

Access to far off BBS's and chat nodes would become far easier if more
gates like these were known of. The current method for me is four or five
node hops across the UK to the LONNY wormhole, so I can then connect out
to the USA, but this is so SLLLOOOWWW and unrealiable. It is the same sor
sort of route for the International Chat node, and I would like to be able
to chat to amateurs wordwide without all of that hassle!

Does anyone have any more info?

Thanks, de Lee Volante, G0MTN

Packet: G0MTN@GB7XJZ.#48.GBR.EU Email: ljv@soton.ac.uk

PS This is my first ever post - so apologies if I've broken an
unwritten UseNet rule :-)

Subject: PacTOR FEC timing/format issue
To: ham-digital@ucsd.edu

I recently completed testing a TI-DSK DSP module running
the exciting new HB9JNX software, "TERM".

When transmitting a CQ in FEC mode the actual signal had
ARQ timing and sounded like a QSO instead of the more fam-
iliar higher speed stream of AMTOR and PacTOR FEC sigs. A
contact in FEC mode QSO on 20M confirmed that it looked
and sounded very strange to K7RD.

I inquired with the author, Tom Sailer, and he responded
that the DSP based code was operating AS IT SHOULD - i.e.
per the SCS specification. He further asserted that the
ARQ timing (chirp...chirp...chirp..) enabled the listening
station to actually SYNCHRONIZE with the CQ instead of
just hoping to catch a strong enough sig and see what was
being xmitted.

This is the first time I encountered this issue. All other
PacTOR stations that I have worked used the stream FEC
mode. I have not worked an SCS equipped station and can't
verify that they operate in this same manner. Would anyone
care to comment on this. If SYNCHRONIZATION is the proper
method, then why haven't other TNC mfgrs used that tech-
nique ?

I think that because I have been trained to listen for the
stream FEC I simply bypass those stations that sound like
ARQ mode xmissions. This means that if I heard the ARQ
rythm I would assume that due to propagation I couldn't
hear the other station and move on. As an xmitting station
I wonder if I would ever get an answer to my CQ :?)

TNX **disconnected**

-> Has anyone had any luck using this radio and TNC? I seem to have
-> trouble with the 440's discriminator (marked FSK on board) output
-> driving the NB96's receive audio.

->
-> Any sage advice/observations appreciated to brownell@tigger.jvnc.net.
-> Thanks.

Having recently done several diff. IF interfaces, my guess is you have
an impedance mismatch between your discriminator and the front end of
the 9600 modem. You should be connecting on the side of the
discriminator that leads to the AF section. Try a 5 MFD non-polarized
capacitor in series with the modem and the IF.

This particular problem has driven me nuts several times. While the
modem mfg. will claim that his modem has a very high impedance IC (like
a TL082) as the frontend, you will notice that they often use a 5-10K
resistor as a pull up curcuit on the input side of the TL082. This
completely drives the discriminator curcuit to zero. You need to
eliminate that DC component.

I run RTTY, AMTOR, and PACtor on my Yaesu 990, and have never had any problems with the power supply or overheating. We've run 48 hour RTTY contests (the fan runs plenty often during them) and held very long ragchews on RTTY, which is 100% duty cycle.

On Amtor I've gone an hour or more in a qso, and similar on PACTOR. It should not matter to the radio whether the PACTOR or AMTOR user is a keyboarder or a BBS, I would not think. Since the protocol (AMTOR at least, I haven't looked at PACTOR) is syncronous, it is necessary to send characters even when the user is not typing. Perhaps you were referring to the fact that the station pulling 30 or 40 messages from a BBS would not reverse the connection and thus one end would have to be sending longer packets than the ack/nak from the receiving end. Even so, it just depends on the rig's ability. If the rig is rated at 100% duty cycle, then it should handle it. The 990 is so rated.

One curious question: If one station is sending 30 or 40 messages before turning the line around, when does the receving station get to ID? It seems to me that more than 10 minutes may have passed...

To: ham-digital@ucsd.edu

HI Everyone:

I have a kantronics KPC-3 TNC and 486 IBM computer and a 2 meter radio.
In our area we dont have full service BBS. I was thinking of setting up
a full service BBS so that people can read messages relatively easily.
I would like to get it started soon. I have access to internet ftp sites,
will anyone familiar with BBS point me out to how to setup BBS and which
software will be of happy with the above mentioned hardwares.

I would appreciate any help in setting up full service BBS.

Thanks a lot.

I was working for a company that did some testing of that radio on packet at both 1200 and 9600 bauds. The 1200 baud operation is great, the 9600 baud operation is not as good as some other radios.

Most notibly, radios that modulate the PLL directly don't work as well as radios where a crystal oscillator is modulated. The problem is that the PLL tries to correct for the frequency error introduced by the applied modulation. The IC-281 is a radio who's PLL is modulated. The Alinco

DR-1200TH and DR-1200TH2 also fall into this catagory. If you're looking
for 9600 and top-notch performance, the IC-281 is close, but not optimum.

James,

I don't know much more than a tame crow, but...

Well, I'm about to do the same thing myself, so maybe we can help each
other. The reason that there is no information provided is probably because
it depends upon the EPROM burner that you are using. The one I use simply

takes an image file and burns it into the EPROM. First, however, I think you have to use the editor to set those parameters which go in the EPROM. I just got X-1J R2, and haven't looked at the tools (if any) which come with it.

Maybe someone who knows something will join in here.

From: nothing.ucsd.edu!brian@network.ucsd.edu
Subject: 9600 bps radio modems
To: ham-digital@ucsd.edu

I'm disgusted with the performance of the carrier detect circuits in the three popular 9600 bps radio modems used by amateurs - the K9NG, G3RUH, and new TAPR modems.

None of these has a good carrier detect circuit. All three use a DPLL to discover that there's a data carrier out there, which doesn't really work very well. Those circuits chatter; they occasionally false on background noise, and can be fooled by interference of various kinds.

The K9NG design doesn't do much about that; its DCD output just chatters. If you use it to gate data to the USART in the attached TNC or PAD, you lose perfectly good packets because the DCD chattered off in the middle of a packet. If you use it to key your repeater TX, the radio will thrash all the time because of the false DCD indications.

Sure, in the G3RUH and TAPR modems, additional circuitry has been added to prevent the thrashing, and the output of the DPLL is "smoothed" to eliminate most of the chatter, but there is still one big remaining problem:

They're SLOW!

These things are taking between 50 and 100 msec to indicate an incoming carrier. That's longer than some of the packets. Waste of bandwidth.

I'd really like to come up with some sort of better DCD - and it wouldn't hurt if it had better data recovery performance as well.

Sure, the right answer is DSP. N4HY will tell you that, and I agree. But short of that, is there some approach that'll help?

(Being compatable with the scrambled direct FSK that the current modems use would be a plus, but isn't required.)

I'm the author of KAMterm. KAMterm is a (currently only dos-based)
terminal program for Kantronics TNCs that takes advantage of the Kantronics
host mode terminal interface. This mode basically allows you to do a lot
of things that you can't do in the normal dumb-terminal mode.

If you'd like more information about it, please feel free to e-mail me (be
sure to put ``KAMterm'' in the subject line---I'm ***WAY*** behind on
e-mail, but KAMterm mail always gets my fastest possible response, i.e.,
it's usually only delayed by UUCP delays...and nothing else).

Subject: HTX-404
To: ham-digital@ucsd.edu

I just bought a HTX-404 from er, ah.. Radio Shack, and knowing that they are
made by ICOM and noticing that the battery pack looks the same,
I asked the GBTC (Guy Behind the Counter) about whether I could use
my ICOM battery packs on it. He said no, that if you use a higher voltage
battery pack (for instance a 12 volt one) it "would burn out a little diode
inside the radio"..

Anybody know whether this is true? If so, it seems like a collosal
design blunder, especially seeing as how there is no warning in the
user's manual telling you not to do this!

Not installed v2 anywhere yet - I have the stuff but I haven't been to
any of our remote sites for some time. Currently our local network is a
mix of X1G, X1H and X1J and BPQ nodes, and while they work I tend to
leave them alone (one site has kept its TNCs running for over 10,000
hours without a crash or power fail). I will get round to updating to
X1J v2 sometime though :-)

>not use the FSK capabilities of the rig - is there an advantage ?

I run (not simultaneously, of course :-) both a PK-900 and a KAM Plus
into the FSK connector of a Yaesu FT-990 both for PACTOR and straight
RTTY. No problem whatsoever.

The advantages of going this route, instead of injecting tones through
LSB are 1) the filters in the rig are properly centered, without
fiddling with passband tuning, to where the PACTOR controller wants
to see the signal, and 2) you won't accidentally have the speech
processor turned on and splatter whatever tiny RTTY subband we have.

Nothing wrong with your Omni V at all for PACTOR work. I also own
an Omni-V. Notice that the Omni performs FSK by frequency shifting
an RF oscillator, whereas a rig such as the FT-990 injects the output
from an internal AFSK oscillator into the LSB modulator. The religious
can dance on the head of a pin as to which scheme is superior :-).

For DOS stuff, I would take a look at oak.oakland.edu, /pub/msdos. This
is one of the primary Simtel mirror sites, and has a lot of DOS stuff.

For Windows, try ftp.cica.indiana.edu. I don't know the directory
structure on this one, however.

Hope it helps...

Sounds like you have the "X-on/X-off" terminal data flow setting on. Try
turning it off and also set your computer for hardware flow control (aka
"RTS/CTS"). If all else fails, clear the memory in the PK232 by removing
power from the unit, then remove the battery jumper. Wait at least 60
seconds before you replace the jumper. If that does not cure the problem
and you are SURE that your cable is good, call AEA.

I have a friend who run's KaGold with a KAM+ and Likes it very much.
It supports PACTOR/RTTY/AMOTOR/ (GTOR I think) and PACKET !
I have used a version of it called TESTDRIVE for VHF PACKET and like it

But the TNC I use HAs some Limititions using Kagold.(KPC3).
I think that you KaGold is a good Choice.

The receive audio is available unfiltered but buffered on pin 11 of the
front panel control connector.

The Mitrek *IS* a varactor-modulated radio. Just cut the lead feeding
audio into the channel element (lift R505, as I recall), and shove the
output of the modem into there.

You can feed the TX audio into the unused pin 18 (the blank fat one)
for a seamless installation. I have about a dozen of these in service
in precisely this way.

sd.edu
Subject: Help: Routing with X1J
To: ham-digital@ucsd.edu

The problem is quite simple. We can't get our local X1J node to respond to
a 'ping'. If I ping the next node down the line then the local node takes it
and sends it on, the remote one generates an echo reply back to the local node
which then does nothing.
So the routing is mixed up somehow.
The local node address is 44.135.128.6 and there's a route entry for
44.135.128.0/24 Port 0 (AX.25)
Any 44.135.128.0/24 address is one that is local to the node (e.g. mine is

44.135.128.1). If the local node sees an ARP request for its address then it does
respond to that. But anything else that it ought to send gets lost somewhere.

What routing/arp entries are required to make the node spit out packets that
are for local users?
Pete

X1J will not respond to pings at all.

Not sure I really understand your question Pete. I was having some trouble
myself with some X1J stuff late last year. Turned out to be total cockpit
error.

A few you may want to add to your list is:
0.0.0.0/1 (to wherever your IP gate is)
128.0.0.0/1 (again, to wherever your IP gate is)

Keep in mind that the X1J is not a full implementation of NOS. It won't
ask for ARPs, nor can you ping it. There is just not enough room in the
ram for all the code.

If you are wanting something a bit more NOSish, try a Gracilis PacTen.
We have one on our network and it is truly an amazing device.

Subject: PK-232MBX vs. MFJ-1278B
To: ham-digital@ucsd.edu

ST>narrowed it down to the MFJ-1278B and the AEA PK-232MBX. I'd love to

I have the MFJ1278B. This is the only TNC I have had, so I can't really
compare.

ST> "random code generator" (?)
This random generator allows for practicing CW. I have never used it.

ST>Is the MFJ fax really full-color, or is it "color shading" instead of gray?
I think it depends on the transmission mode????

ST>How common are SSTV transmissions?
Common enough on 14.230, if you are looking foor SSTV you will
usually find some there.

ST>Do most people find 18k to be adequate RAM?
I assume this is on the mailbox? The minimal I got on the 1278B
is plenty enough for me. I think it is 16K? Thats 16K worth of
messages sent to your mailbox. Depends on how much mail you get
and how often you want to review/delete your old mail.

ST>Are there any features that make one unit significantly better than the othe
ST>Are there any glaring problems with either?
I have had some problems with the MFJ during Pactor, which is
my favorite mode. The tnc will occasionally lockup. I seem to have
more problems than others on the band during my links. So much of
this may be from problems in my station setup, RFI etc.
If I would have doled out the $59 for the MFJ program that supports
the tnc I might feel better. The reason I went with the mfj was for
sstv and not having the supporting program makes this almost
impossible. I am trying to write some software to display the
pictures myself, but it is slow going. If you get the mfj I would
strongly reccommend getting the supporting program. It is an extra
$59 but will allow you to receive sstv/fax with real-time display.
Reports on the rest of the mfj terminal program I have heard are not
too good. But you can use most other shareware type software for
packet/p[actor/rtty/etc. To date I have not seen any software that
supports the mfj sstv/fax modes. I have used LanLink for the other
modes, and it supports the mfj very well.
My packet reception on 2 meters is not as good as it should be. I only
receive packets if I get a full scale signal. My 2m reciever has 5
bars indicating signal strength, and I do not receive good packets if
only two bars are lit. I think this is more a problem with my tnc than
with mfj tnc's in general, since another ham I know, who has an
mfj1278 (no B) told me I should be recieving packets with that type of
signal strength.
I have talked with mfj tech support about 3 times. Once was on the

lockup problem and they immediatly sent me a revised eprom, no
questions asked except for my mailing address. I received the new
eprom about 3-4 days later. I had to ask twice for specs on the sstv
formats for writing my own p[rogram. I think the first request which
I made at the same time as the eprom revision got lost. The second
request was responded to promptly. I received a disk within a week.
Overall I would rate the dealings I had with their tech support as
excellent. It is hard to get through to them at first, (phone
busy, 800 number always busy) but once I did, they took care of me.

ST>better designed TNC, with a lot of support from AEA and amateurs. He
ST>claimed the filtering and reception on the PK-232 was superior to the
ST>MFJ.
There are a lot of PK232 users out there I have linked with. Very few
mfj users. I have linked with about 5 - 6 mfj 1278b hams. If I
remeber right, they all reported the lockup problem in Pactor similiar
to mine. This lockup is more frustrating than devasting. When it
happens, I turn the tnc on/off, re-enter my callsign, and re-link. I
don't know if the AEA has a similiar problem.

Didja look into the KAMS at all? Reports on the new GTOR mode sound
really good. I dunno if MFJ or AEA are planning (or even can if they
ant?) on adding this mode or not?

According to the TEKK people in Kansas City all KS-960 LOW-BAND radios
shipped for the last 6 weeks have had a mod that allows 9600-baud operation.
They will make the mod at no charge if the unit is within warranty. Also,
a mod article on the TEKK radios has or will be published real soon by
NEDA. I found a file on the WA6RDH landline BBS. The word is that the
mods improve throughput by 40%.

Subject: HELP! - Sharp PC-6200 lcd & docs
To: ham-digital@ucsd.edu

hi, mitch wa4osr here in mobile, alabama...

my sharp pc-6200 was dropped and the lcd display
was damaged... upon taking the display apart, one
of the surface mount column drivers was cracked...
rendering the display unusable... therefore,
i am in desperate need of the lcd display panel...
the part numbers on the display panel are LM64N671
and 90D13145W ... both numbers are on the panel...
my pc-6200 is actually a pc-6220, which
i think indicates that it has a 20 mb hard drive...

i bought the pc-6220 used with absolutely *NO* docs...
it has the 2400 baud internal modem... i need *ANY*
info, but especially would appreciate a copy of the
owner/operator manual... i will gladly pay for
copies/postage...

if anyone can help with a source of the lcd panel or
with the docs please email me or call me collect
at the below numbers...

thanks for any help/leads...

Yeah, that is the one problem with X1J nodes. Other than this, they are
perfect. Guess the real thing to do is have one station per frequency/node
act as an IP router.

Simplest way I can think of is to use a pre-made A/D converter and sample the audio output jack of the radio. This would be a cool way to get random numbers too... (if it worked)...

I'm sure the A/D converters exist, and I've seen an RS232 chip which would let you send your output to the mac via the serial port. My guess is that the best way to do it would be to have a poll/response method, where you send a request through the serial port to the box and have it sample the line voltage, then send the value back. That way you can keep track of the time via the computer.

good luck,
Dan

>Chris Wysopal, n1obj

The firmware with built-in KISS came along a bit later than that, I think. You can get a firmware upgrade from MFJ or TAPR, but will also need to upgrade from 16K to 32K of RAM to use the newer firmware. If you only want to use KISS, you can get a KISS eprom from TAPR, which will work with 16K or 32K. MFJ and TAPR also have the RAM chips to do the memory upgrade. If you have the capatility to make your own EPROMs, TAPR has a disk with the rom images and a bunch of other stuff for $3.00.

Subject: Ramsey FX440 and PacComm NB96 at 9600?
To: ham-digital@ucsd.edu

Has anyone had any luck using this radio and TNC? I seem to have trouble with the 440's discriminator (marked FSK on board) output driving the NB96's receive audio.

Any sage advice/observations appreciated to brownell@tigger.jvnc.net. Thanks.

I need information on basic netrom chip burning. I have all the
paperwork on TheNet X-1J Release 2 but they do not say how to burn
basic EPROMS. I have sent my $15 to the North East Digital Assn,
Manchester NH for their TheNet X-1J network guide but nothing
received yet. I'm more than a little miffed at the lack of help
by a certain SYSOP on the Northern Calif DX Packet network.

Any help on getting started will be greatly appreciated.

I run (not simultaneously, of course :-) both a PK-900 and a KAM Plus
into the FSK connector of a Yaesu FT-990 both for PACTOR and straight
RTTY. No problem whatsoever.

The advantages of going this route, instead of injecting tones through
LSB are 1) the filters in the rig are properly centered, without
fiddling with passband tuning, to where the PACTOR controller wants
to see the signal, and 2) you won't accidentally have the speech
processor turned on and splatter whatever tiny RTTY subband we have.

Nothing wrong with your Omni V at all for PACTOR work. I also own
an Omni-V. Notice that the Omni performs FSK by frequency shifting
an RF oscillator, whereas a rig such as the FT-990 injects the output
from an internal AFSK oscillator into the LSB modulator. The religious
can dance on the head of a pin as to which scheme is superior :-).

Hello,
due to lack of information on AEA's DSP2232 (e.g. SSTV) I started
a mailing list on this gear :-).

If you would like to subscribe write to:

dsp2232-request@rmi.de

with "subscribe" in the subject.

If you would like to contribute information, please write to

dsp2232@rmi.de

I hope, information (and users) will start soon.

Regards,
Rupert dl3no

For DOS stuff, I would take a look at oak.oakland.edu, /pub/msdos. This
is one of the primary Simtel mirror sites, and has a lot of DOS stuff.

For Windows, try ftp.cica.indiana.edu. I don't know the directory
structure on this one, however.

Hope it helps...

Sounds like you have the "X-on/X-off" terminal data flow setting on. Try
turning it off and also set your computer for hardware flow control (aka
"RTS/CTS"). If all else fails, clear the memory in the PK232 by removing
power from the unit, then remove the battery jumper. Wait at least 60
seconds before you replace the jumper. If that does not cure the problem
and you are SURE that your cable is good, call AEA.

I have a friend who run's KaGold with a KAM+ and Likes it very much.
It supports PACTOR/RTTY/AMOTOR/ (GTOR I think) and PACKET !
I have used a version of it called TESTDRIVE for VHF PACKET and like it

But the TNC I use HAs some Limititions using Kagold.(KPC3).
I think that you KaGold is a good Choice.

I am looking for recommendations for software for the KAM Plus. My
primary interest is HF communications modes, PACTOR/RTTY/AMTOR/GTOR.

I understand Kantronics makes something called Hostmaster II, plus I've
heard mention of a package called KAMGold.

Feedback would be appreciated?

Subject: UPDATING 1270 ROMS
To: ham-digital@ucsd.edu

I know of no combination of keys to accomplish KISS mode if it is not
included in the ROM version in the 1270. However, I'm fairly sure you
can still get a new ROM with the KISS command from MFJ.. I did about
a year ago for the same reason. Give them a call and I think they
can solve your problem..

To: ham-digital@ucsd.edu

Is there anyone using an FT-726R and 9600 baud modem? I'm trying to find
the easiest and safest way to connect my G3RUH modem to my FT-726R. I've found
the output of the demodulator for receive that is easy to access, but haven't
found a similarly easy spot for injecting the xmit side into the modulator.

If anyone knows of the easiest (least impact on the FT-726R) way to connect
up a high speed modem, I'd sure like to hear about it.

Yeah Dave, I apparently did have it set wrong. N7OO sent me mail about this Saturday night. I looked at the instructions and redid one of the nodes yesterday. It did ping. I stand corrected.

Out of curiosity, what experience do you have with the X1J v2 code? We just got the code here in the KC area and are getting ready to blow new eproms this week.

Viva la X1J! Viva la Gracilis!

The crynwr folks have some mighty nice drivers, and from the looks of
it, they provide source. It should be possible to modify one of the
drivers to work with a TNC via KISS. This is a bit over my head, otherwise
I would attempt it. If given some pointers/suggestions/ what not, I'll
give it a go. etherslip.com looks like a good candidate for munging...

> It's not much to ask. A $59 286 motherboard, a $40 case and power
> supply,a $59 floppy drive and controller card, a $110 Ottawa PI card...

It's no problem for *me*. I've already got a 4 node network in the shack and have no worries about adding to it...other than cash for the bits and the electricity bill :(One thing you need to bear in mind though is that in the UK we have to multiply all your dollar costs by the exchange rate. I know that's the wrong way round...but that's how prices work over here :(

For Mr Joe User who is a black box operator that buys a TNC off the shelf, attaches it to a really dumb terminal (usually one that locks up when presented with a line feed character :) or the only computer they have (usually an early 1980's vintage Z80/8080/6502 based machine with 8/16/32k memory) the addition of a super-high spec Ethernet box (super low-spec to people like you and me) is out of the question.

What is difficult for techies to appreciate is that the average TNC user doesn't really know how it all works (like the average radio amateur not really understanding how a TX works :) Asking someone like that to set up NOS is going to result in one of two things...

1) Total failure to get it working (this is the 90% result). This usually puts the user off after spending a few nights not getting anything working at all.
2) Success in getting it to work, but set up with such awful parameters that they ruin the local network...like 16k packets at 300 baud.

I've been running packet for 8+ years now and I always shy away from NOS...mainly coz the config file is so enormous and if you don't get it exactly right nothing seems to happen. Imagine being a new packet user prsented with that...

I know it's not as bad as it looks...it's just a case of figuring it out for the first time that's a big job. Mind you, I can't get it to run properly when compiled with BC++ v4...but that's another story.
> Fortunately, there is an alternative, it's called
> Linux...

Already got it, but I had to dump it off the machines to make space for other things (like 140MB of BC++ v4 compiler!!). Linux is fine...but as the vast majority of programs I use run under DOS/Windows it really needs a machine dedicating to it full time. One of these months....

minutes, i believe. the marine DGPS systems being setup by the US and
Canadian coast guards broadcast pseudo-range corrections, at 50 bits
per second, on top of existing navigation beacons in the 300-500kHz area.

>whatever they call it nowadays) so that it operates with KISS rather
>than slip. KA9Q does a fine job, true, but it is an application and not

It's not quite as simple as this. Amateur packet is a broadcast medium and needs an address resolution protocol. SLIP is a point to point protocol and doesn't use an address resolution protocol. A lot of TCP/IP software actually doesn't support SLIP class drivers, so there are SLIP drivers which spoof ARP to keep the stack happy. Also packet drivers assume that the higher software provides MAC level header information. To run with normal stacks, you have to run ARP within the packet driver and map ethernet or token ring addresses into callsigns within the driver. (I think you also have to handle parts of the AX.25 protocol, if you are using KISS.)

I seem to remember that there is an AX.25 class for packet drivers, but that would only work with AX.25 aware stacks (will KA9Q work with such drivers?). All this processing is going to make a KISS packet driver big and non-trivial to write, but not impossible. It may have been done, but I would have expected it to have been mentioned in this thread by now, if that were the case.

> I see know no reason why a computer filter with a carefully
> selected mask to sidetrack messages with certain words, etc.,
> for human inspection would not satisfy the regs.

Such filters exist for some packet BBS packages. They work quite well,
but certain childish idiots who like to use offensive language like to
find ways round them. There have been fid*les and F I D D L E S and even
fiddles that used the upper-128 accented chars of the ASCII set for the
dodgy words. Each time the filters are modified to catch another type of
word corruption, the childish hackers try their best to find some other
way.
At the end of the day, the regs makers don't (and probably never will)
specify how you should check or what is acceptible...they just say that
you should check and that you will be held responsible if you let
anything loose onto the network :(

TAPR should be able to send you a copy of the source code for the TNC-2 eprom. I don't know if there would be a charge (beyond disk production and postage or not).

The KISS eprom for the tnc-2 both in source code and object is available from several ftp sites and on the QRZ CD-ROM.

TCP/IP Network Meeting
R:940516/0722z @:G7GPA.GB7BAD.#23.GBR.EU [Nowhere]

;;;Emacs-fodder: -*-Text-*-

Greetings, TCP/IP-people,
After the success (even though I managed to erase the minutes) of last year's Region 4 TCP/IP meeting, it gives me pleasure to announce:

The Second U.K. TCP/IP-AMPR Network Meeting

Date: Saturday, 18th June 1994 Venue: Nottingham University
Cost: Free Open to: Anybody
(note - date is provisional, but will only change if there's a _very_ good reason, i.e. NFD, World War III :))

This meeting is being held as a forum to discuss new ideas in TCP/IP networking by radio, and to help develop a plan for developing the network and increasing connectivity to produce a working plan. Other possible topics for discussion include - software, networking under alternative systems (Linux!) and anything else that's of interest.
I've called this meeting 'UK' as last year's meeting covered more than merely Region 4 specific issues, and also because I think it would be a great idea for us all to get together for a talk and a few beers, to hopefully produce a little more cooperation between different parts of the country, which would be universally beneficial.

A few suggested topics for discussion:
- Domain naming conventions (and problems with name service)
- Mail delivery over the wide-area UK network
- Distribution of network news
- Addressing schemes (we need to sort this one out! ;-))
- Networking with Linux (and other Unix versions)
- Interchange of mail and news with the Internet at large
- Interfacing with the vanilla AX25 network, and development of a common carrier?
- Trends in TCP/IP networking as seen on the Internet (Gopher, WAIS, WWW, high-speed networking)
- The legal issues raised by the above (sigh..)

Anybody who wishes to add something to the agenda (the above are only suggestions), please get in touch with me (addresses at the end).

If anybody would like to attend (which I hope you will!), then also drop me a line so I can get a rough idea of numbers and work out which room I need to book.

Please put 'TCP/IP Meet' or similiar in mail subject lines so I know where to file it. Thanks..

1790. Re: An open note to Gary Coffman, KE4ZV

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-04 22:22:35 UTC
From: davidj@rahul.net
Message-ID: <Cqw8tn.HIH@rahul.net>
Source record: 48888

Gary's letter isn't here, but Doug's open letter is a fine start. And we have all read replies about one technical angle or another being the seed of our discontent. But have we ever thought about applications for packet radio? Excuse me, but what is this thing for?

We get bored pretty quickly with keyboard-to-keyboard communications. A regular BBS is pretty well out of the question, even at 9600 baud the throughput is nearly unusable. There are other things we can do, however, and I wonder why there hasn't been more development outside of the strictly technical. For instance:

ARESPACK from WN6I tracks who/where/what during a disaster. APRS plots locations of stations, DF headings, station status, etc on a map from information transmitted on packet. And the DX cluster is a perfect example of how we can use this mode to make things nicer.

Pedro Colla wrote a long article, pointing out what we have here: it is a low bandwidth, anarchic, highly resilient network that will work, eventually. Practical throughput, once there are more than two stations involved, is a few tens or hundreds of baud. It is a thin network. Why don't we give up on thinking of it as a ham Ethernet and start working on more applications where this sort of information pipe will do some good?

Which one? I've been looking - give me an FTP site.

: What you have to have is the entire AX25 set embedded in
: the driver so that it can enclose the IP packets in an AX25 envelope
: and then enclose *that* in a KISS envelope for delivery to the KISS
: TNC. An AX25 driver is not something that can easily be made a TSR.
That's fine. All I want to need to do, is run a driver, much like
slip8250.com, that will turn the TNC into an 'ethernet' card. Heck,
they've done it with just a serial card, it seems like a TNC should
be a whole lot easier.

: There *is* a kernel mode AX25 driver for Linux, and one that runs in user
: space for Sys V Unix. IMHO, if you want kernel level support features, you
: need to run a proper operating system that's designed to support such
: features. Linux is one that will run on a PC.
Got it, run it, love it. BUT: MOST PPL I KNOW OF (for some reason or
another) WON'T RUN LINUX! That segment would be best served with a
driver.

: DOS is a glorified program loader,
You're being generous!

: no amount of kludges and bandaids (such as Windoze) can fix that.
Windoze is still a kludge. Unfornately, it's a popular kludge.

If you could point me in the direction of a driver that will allow my
TNC to run tcp/ip under dos, and speak to all of the nifty applications
(such as NCSA Telnet, Popmail, etc) that would be very good!

From: wy1z@meceng.coe.neu.EDU
Message-ID: <9406050211.AA09828@meceng.coe.neu.edu>
Source record: 48882

I just received a new AEA PK232MBX TNC, and tried using JVFAX to decode WEFAX signals, but all I got was a white blanket on my screen.
I speaking with a friend of mine more familiar with JVFAX, he said he believes the program will only work with the special circuits recommended for specific reception and decoding of WEFAX.

Do any FTP-able programs exist for reception of WEFAX via a TNC, or do I need to spend a few more dollars and buy AEA's wefax s/w?

Thanks much for any help anyone can offer.

Then why can't we abandon the AX.25 layer entirely and just use the
KISS-mode TNC as the dumb modem it is? I can't find my FCC rulebook
right now (and I think it might be out of date anyway), but wouldn't
that count as an "unspecified digital code" which would be legal
as long as you transmitted an ID every 10 minutes or so in an acceptable
mode (CW/voice/packet ID frame...) just have your TCP/IP interface
transmit a packet ID frame every 10 minutes, and you'll be OK, I think.

: Jeff, k9ja

I had a similar problem with the MFJ firmware. According to MFJ, there is
an (apparently undocumented) command that is *SUPPOSED* to disable the
reset timer. The command would be "param 250" if nos would accecpt it (my
copy of jnos won't). The command can still be entered from a pc/clone via
standard commo programs and the alt-keypad trick. The bad news is that this
never worked for me. I'd be interested in hearing from anyone for whom this
"param 250" (kissdog off) HAS worked! I finally just downloaded the tapr
kiss firmware from ucsd.edu and got a friend to burn it into a prom for me.
That's how I solved this problem. - 73 de Glenn wb6w@netcom.com

I don't have an answer, but have seen the problem with a slightly different configuration (386, and a different packet driver). It occurs when I connect via ethernet to a VAX or a Sun, both of which are set up to service large numbers of users. The VAX session usually hangs up before it gets through the messages of the day. The Sun will crash when I do an ls -l command on a moderately big directory.

I inquired on other groups about this and was given a suggestion that the telnet escape character default for NOS was the problem, but in fact it made no difference.

I suspect the problem may be that NOS does dynamic memory allocation and just can't do it fast enough to handle a large amount of data coming in fast, i.e., at ethernet speeds. Try using the "mem stat" command after this happens. I think a solution might be to recompile a NOS with less stuff in it, to use less memory. But I've never tried this.

The problem is not inherent in the ethernet interface per se, I can connect NOS via ethernet to another NOS box, to a Minix box, or to a couple of Linux systems. But these systems don't output as much data as the VAX or Sun.

Version 2.20a of the G8NPF Personal Message System (NPFPMS) is now available
as a self-exploding file 'NPF220A.EXE'. NPFPMS is designed to be used with
G8BPQ node software (version 4.05 or greater) on PC-AT class (286 and higher)
machines. New functions since the last Internet release 2.16d include:-

* Support for FBB Unproto broadcasts to maintain message lists. Messages read
from FBB BBS's by the AutoRead function can use compressed file format.

* Archive Message facility added.

* Virtual (ram) disk (or a different hard disk) support for temporary files.

* Extensions added to YAPP transfer protocol.
Crash recovery. Resume an aborted file download.
YappC checksum mode. (as used by FBB)

Plus many other improvements. NPF220A.EXE and information file NPF220A.TXT can
be ftp'ed from :

ftp.demon.co.uk [158.152.1.69] /pub/ham
ftp.funet.fi [128.214.248.6] /pub/ham/packet/misc

If Gary will give his permission, I can post a copy of his letter. It's
in the archives somewhere on our PBBS here.

>Pedro Colla wrote a long article, pointing out what we have here: it is
>a low bandwidth, anarchic, highly resilient network that will work,
>eventually. Practical throughput, once there are more than two stations
>involved, is a few tens or hundreds of baud. It is a thin network. Why
>don't we give up on thinking of it as a ham Ethernet and start working
>on more applications where this sort of information pipe will do some good?

I agree--I wasn't necessarily suggesting that we should create an alternate
Internet. The I-net examples I used were merely suggestions. I do think,
though, that a TCP/IP network wouldn't be bad. Ie, e-mail could be handled
by presently-existing SMTP applications. We could use things like FTPMail
for file/data transfer. We could replace the existing haphazard system
of bulletins with something using existing Usenet protocols, mail routing
would be expedited.
It would also be easier to support things such as (I think)
Gary Coffman suggested--ie, a simple FORTH-like language to carry out
remote tasks. I envision something like:

```
: MAIN
"STTNG" dbselect ( selects the database to be searched )
"worf" "riker" "troi" and and ( selects keywords to search for )
"picard" "riker" or not and ( selects keywords to exclude )
SEARCH ( executes the database search )
;
```

which could then be compiled into a tokenized string that would be uploaded
to the interpreter and executed. If it worked, it'd self-delete and mail
the results back to the originator, else it would be passed onto the next
computer in the chain.
I've actually sort of spec'ed out something along these lines. It
wouldn't necessarily have to support recursion in the initial stages, and
could be written with a relatively simple YACC grammar, methinks. I think
that the TinyMUCK code which supports the MUF programming language would be
a good example of how something like this could work.

Ack. I guess I've gotten off my original track. But anyway. This is, BTW, something which could be adapted to the Internet with fantastic results. Imagine being able to mail such a search program off to an archie server, or a network of WAIS servers.

Food for thought.

Hi there:

This question is coming from someone who is Internet experienced but has very little HAM experience. I am looking for a gateway to communciate with someone who has an address on a Packet BBS in AZ. I know gateways between the Internet and Packet exist. Can someone tell me where one is and how to use it? Please e-mail me the answer to this question since I don't really read this newsgroup.

- Thanks -

That wouldn't be very helpful to the ham community - those beacons
you speak of (285-325 kc is the maritime beacon band; the aeronautical
beacons operate from 200 to 415 kc) only have a range from 5 to 50 miles.

FAR has that board for sale. See their add for address. It's < $5.

But... the circuit is so simple you can use a scrap of perfboard just
as well. I bumped into Ben Vester at Dayton and he pulled his out of
a pocket to show me, and.... it was a 2" square of perfboard.

Good luck, Kurt

WB6YMH and I proposed the news broadcast scheme some years ago; it's
been tossed around a number of times since, but no one has gotten around
to writing the actual client (there is a sender). Certainly the various
clients intended for use with the PACSATS could (and do) work, but a
more purpose-built client would be better.

I envision that the news would be broadcast CONTINUOUSLY in round-robin
fashion - no need for the transmitter to ever unkey. New articles would
be added and old ones expired from the list over time.

User stations would run a background process (a "TSR" in MS-DOG parlance)
that would suck in the articles as they're broadcast (selectively or not
as the user specified), squirrel them away on disk, and update an index.
Since the user station never has to transmit - fills happen automatically
from the repeated broadcasts and error-correction coding could help -
there's no issue of unattended transmitter operation - it's receive only!

When the user stopped playing space blaster, gets back from the office,
or whatever, he'd be able to fire up a news reader and read the articles
that had appeared. Read them FAST, off local disk, not over the air.

I know that the idea of a continuous bulletin transmission doesn't sit
well with a lot of hams, but in the USA it's legal and it's clearly efficient.

Some day I or someone else will write the client and then it'll be time
to clank on the sender. You know, a single 10-watt transmitter on a
single 2m frequency on one mountaintop here in SoCal could cover
thousands of square miles and serve thousands of hams all at once.

And a falsely-perceived need for change has held back progress even more. You can't just write off a worlds worth of equipment because it is now possible to go twice as quickly.

Regarding your lack of sympathy, are you unsympathetic to the unwilling or the incapable?

How many times does it need to be proved that the average person does not have the intellect to keep up with the state of the art? Perhaps we should take away the licences of all those black boxers who can not pass a new, suitably difficult, technical exam?

The reason people refuse to learn the state of the art is that the majority of those who are at that level are either incapable of teaching others or make things so difficult to understand that no-one else has a chance. For example, TCP/IP. There are a lot of developers out there who have written some very clever software. In the main the manuals are terrible. They are concise, exact and tell the beginner nothing. Acronyms are used all over the place, yet no list of acronyms is provided so you need to remember each one. Software that is not easy to use is bad software. If you require a large amount of technical insight to use an item, then it is badly designed.

When it is so hard to get started, no wonder those with less ability give up. I agree that we need to get rid of the CB mentality type of black box operator who knows nothing and is able, but not prepared, to learn.

Oh, It'd be legal, except for forwarding third party traffic (that's
any traffic other than that generated by the two stations directly
involved in the transmission), but it would be *incompatable* with
every other packet system, and it would have *no link level protocol*
to manage data flow on intermediate links. So forget using it that
way in a *network*.

Indeed, a TCP/IP network *isn't* bad, and it *does* handle SMTP, FTP, etc right here and now on our 56kb systems, and has been for several years. It's *not* a new idea, it *is* being done. If it's not happening in *your* area, go out and preach the gospel at ham club meetings like we did. There's no need to reinvent the wheel, NOS is here, it works to the extent that's possible on a single threaded DOS machine. TCP/IP works a *lot* better when incorporated in a *real* OS though, and then NOS makes a fine router to get it on the radio network.

Yes, a powerful search agent is much more efficient of network bandwidth
than randomly downloading the directories of every server on the network
looking for a file topic. But to make that interpreter work, you really
need a multitasking OS, otherwise you kill that node's network activities
while it executes your search request. That's also why you don't want to
implement TCP/IP as a driver in a DOS machine. If the network is active,
your machine will spend most of it's time in the driver routine verifying
packets instead of running your application. Or conversely, it'll spend
it's time in your application and fail to respond in a timely manner to
a packet addressed for your machine and cause unnecessary retries on the
limited bandwidth network. Pre-emptive multitasking is necessary to deal
with the competing demands of network and application.

Yes, now go ahead and write it. The ham internet can use it too.

So? How much range do you think the repeater proposal that started this thread would have? To work, DGPS has to have the benchmark system in the mutual footprints of the *same* set of satellites as the rover systems. That mutual footprint isn't very big, so limited range RF systems are *perfect* for the job.

Oooooh, I couldn't have said it better myself. I won't hobble packet
to a stoneage TNC and glass TTY just because some hams won't use better.
I do suggest accomodation where possible, and cooperation as well, but
if a user won't update to modern methods, then he'll have to miss out
on modern applications and benefits. His loss.

Gary

SLIP is a point to point protocol for a non-contending channel. Unlike
ethernet, or AX25, it does not encase the packet in a uniquely addressed
link level envelope, nor does it perform any media access control.

Gary, your information is many years out of date. Constructing TSRs with
state information, disk I/O and beyond are not difficult, and toolsets
are available to assist in such creations. Preemptive multitasking is NOT
a requirement for networking. Look inside a router from any of the major
router manufacturers. You will find NON-preemptive scheduling, if you
find much scheduling at all. Summary: TCP/IP does NOT require Unix.

>

Windows is not at this stage a kludge or bandaid to DOS. Those in the software business who thought that are generally not in the software business any more. There are several TCP/IP stacks running as VxD drivers under Windows. There is no reason at all why an AX.25 stack could not be placed under them.

All that is needed is someone with the time to dedicate to doing this work. Perhaps someone could get permission to do it as a master's project or something.

Right. He's out of luck. Too bad, his loss. We can't hold back all
users simply because some can't or won't keep up. There's still
Morse for those folks.

Yes, the small baycom devices are nice and tiny, though they are not TNCs, they are modems. The software in the PC must do lots of work to get timings right. All for the lack of a proper SCC chip...

It would be neat to find a REAL TNC in a PCMCIA card, and have a fully portable fully featured TNC.

Currently looking at the "paket 5.1" program from Australia. Is this the latest version of the program or is there an update available! If there is an update - where is it available for downloading? I do not have access to CIS!

Thanks for any information that you have to offer on "paKet 5.1" I have tried contacting the author, the USA lliason but no response from either of them for weeks now!

1825. Macintosh Amateur Radio Software - June 1994

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-06 19:25:57 UTC
From: "Terry M. Stader" <p00489@psilink.com>
Message-ID: <9406061425.AA57718@worldlink.com>
Source record: 48830
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.info

Macintosh Amateur Radio Software - June 1994
Version 1.0.7

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: I am continuing to add more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections!

The newest e-mail I have received indicates a new product soon to be released for the Mac which has been in the DOS world for awhile... the Automatic Position Reporting System (APRS) is currently being beta'd. It is expected to be released soon.

The ftp site at The World is no longer. It has been moved to oak.oakland.edu. Scott-WY1Z is maintaining these file as the Librarian of the Boston Amateur Radio Club. Look in the following path: /pub/hamradio/mac. If you'd like to archive your software.files here, please contact Scott at wy1z@netcomm.com.

Finally we are starting to see soem advances in Callbook data for the Mac. Mark Sproul, author of Packet Tracker, has completely revised the HAMCALL application that first appeared in the Oct 92 issue of the Buckmaster HamCall CD-ROM. This one is very nice. Well done Mark! RT Systems in Huntsville, AL has included a Mac interface for their SAM database. No information on this one just yet... but some Mac users will be getting information to me soon.

Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software. The ARRL ListServer is also carrying the latest version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.
ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4.
Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
NOTE: Diana no longer is supporting this software, she no longer has a Macintosh computer. Diana thanks for your wonderful contribution to the Amateur Radio community for these stacks!

System 7 savy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware. Available via anonymous FTP from simoon.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@simoon.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware. Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads

the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training programs is that this one will not continue sending until you provide the correct answer. Major changes which have been suggested and implemented since last version include: after three incorrect responses the program shows the correct character; the list of characters at the end which will show those you know and those you need more practice on; the frequency of the tone has been changed; volume of the tone has been reduced; the character " - " has been added (dah dit dit dit dah) Comments can be sent as

follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD 21719

*** Packet and other digital modes ***
<NET/Mac 2.3.40>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use. The latest releases have added support of multi-port serial boards like AE's QuadraLink. It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the modifications to NET/Mac. This version (and others) is available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming), mac.archive.umich.edu and oak.oakland.edu (/pub/hamradio/mac/digital/)
System 7

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP packet switches in New England.program.
System 7

<IM/Mac 1.0b27z>
Mailer program for use with the SMTP protocol. Alternative to the BM program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly updating his mailer program. His newest release supports built-in BinHex support, selectable sound chimes for incoming mail, "quoting" of forwarded messages and lots more. If you are not using this program... why not? Check for the latest release in the directory before "blind" ftp'ing. This software supports System 7's Ballon Help and is System 7 savy! Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming).
Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo!!!
System 7 savy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8 July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape and end characters is sofktiss 1.6. The bug and the fix and patch are all correct, thanks for some great detective work. Lots of doc files and drawings included in this archive! Requires the Serial Tool from Apple's Communications Toolbox! Available on the HAMNET forum of Compuserve, America Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).
System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.2>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC,

unlike MacRatt or HostMaster.
A demo version of the product is available at cpre1.ee.iastate.edu
(pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM
Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required
AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA
98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX. Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, !
multiple connects; supports KPC-2,
KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.07>
PacketTracker ver 1.07 is a SHAREWARE program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox which is NOW included in the archive.
System 7

<APRS>
There will soon be a Mac version of the APRS (Automatic Position
Reporting System) software. Folks use this to collect packet beacons, plot channel activity, track chase vehicles for marathons, etc. When it's out, I'll let you know.

<DSK_Loader 1.0>
DSK_Loader is the Macintosh equivalent of the DOS program DSKL. With this program you can communicate with the DSK (DSP Starter Kit) from Texas Instruments. This program bootloads a simple communications kernel and then loads other software using this kernel. Other options are: Fill DSK memory with a certain value; Dump DSK memory into a textwindow, for further processing; Execute programs on the DSK; Graph output from the DSK; Act as a dumb terminal to the DSK.
The DSK and thus DSK_Loader is most interesting for people who want to experiment with Digital Signal Processing at low costs.
For HAM-Radio operators it is a very interesting piece of equipment, Some applications, like the KC7WW port of the W9GR filters are included.
This program is public domain so you can distribute it to others, put it on BBS's, FTP sides, etc. If you encounter some problem s, bugs, find language mistakes in the help-information (english is not my native tongue), or just want to know me that you use this program, feel free to write to the address below, by email, or just postal mail. Please add information about the system you use, and the application you use the DSK for. I also like to hear your wishes for future versions.
Author is available on the internet: G.Polder@CPRO.AGRO.NL. Gerrit Polder-PA3BYA, Prunus 8, 3904 LV Veenendaal, The Netherlands

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging ***
<Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 3.5>
Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes,

figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry. Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!) N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Callbook data tool ***
<Hamcall 2.0>
This is the application that is used to support Buckmaster's Hamcall CD-ROM. This application provides much more data than previous versions including lat and long coordinates. Allows search by callsign as well as Zip Code sorts.
More information at info@buck.com
System 7

<SAM>
Amateur Radio Callsign Database now supports Mac interface. No additional information at this time.

*** Propagation, gray line, DX headings ***
<DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk

with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas
of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.
System 7 compatible.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.

System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)
System compatible

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<MacSPOC>
Author is on AOL and can be reached as adamod@aol.com via the internet.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with

HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

<

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio Zoomer. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftp'able (yet). Internet e-mail.

<CompuServe>
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats.
Call 1-800-848-8199 for information. This site NOT ftp'able. Internet e-mail.

<Delphi>
(more info at a later date) Internet e-mail

<GEnie>
(more info at a later date) Internet e-mail

<Prodigy>
Has ham radio message areas, no downloadable software. Limited internet e-mail.

Is it possible for everyone to single-handedly keep up to date with all
'states of the art'? I understand state of the art in computers pretty
well, but my radio knowledge has suffered as a result. If I tried to
keep up with everything then I'd need to stop working...and then how
would I pay for all this state of the art stuff :(

A very good point, and something I am going to seriously consider.
A good old Compaq portable should do--compact and tidy with the keyboard
and monitor all built-in.

However, there are going to be some who will not want to dedicate a PC
to the problem. The problem can be solved in software, but the software
solution would only solve a particular platform configuration.
For example, if someone were to write a AX.25 NDIS driver, that would
solve the problem for a MS-DOS TCP/IP stack which support NDIS at the bottom,
which, BTW, is probably very common.

Can you imagine running PC Mosiac for an Amateur Radio WWW?

Dave

1831. <<Wanted: CW reader for handi-ham>>

My buddy N3MEQ approached me to help a fellow ham with a hearing problem. He likes to contest a bit, uses NA, likes CW, and wants to try a code reader. I used to have one.

Budget is limited. If you may know of a stand-alone code reader, like the Kam or AEA, or have a software/hardware solution to reading some CW on the screen while still in a contest type of mode, please let me know.

E-mail here is fine. Preferable address is penneys@pecan.cns.udel.edu.

Tnx Bob

> rather be able to do what Brian describes.

> How would one setup such a system?
> Give us some details ...

I'm not sure if you're pulling our legs or what Hank, but here is
what I am using.

I have 6 machines participating in my house ethernet. 3 DOS machines,
one FreeBSD unix box, a Macintosh LC III and a Mac Plus (via a Webster
Multigate). I use Novell Lite between the 3 DOS machines and TCP/IP
between all of them (bar the BBS machine).

One of the DOS boxes, a 286/16 runs JNOS 1.10x15 and has 2 attached
serial ports. One of the serial ports links out to the 4800 baud
radio network and the other runs to my FBB/BPQ bbs. The bbs machine
also has 2 serial ports, one to a 1200 baud user channel and the other
to the JNOS box.

I forward mail for me and a couple of locals to the JNOS box from
the bbs which is then either sent via SMTP or held for connection via
POP3. I get my mail via POP3 from the JNOS box over the ethernet
using Eudora (and MacTCP).

I use NCSA Telnet on the Mac to connect to the JNOS box (and the unix
box) and then I can connect to the BBS or out via netrom or AX.25.

I run MacX on the LC III so I can do X windows work on the Unix box
remotely.

I have IP routing setup so that I can telnet or FTP (using fetch or
anarchie) from the Mac or any of the DOS machines or the unix box
through the local gateway (when its up. :-( ) to other ampr sites.
I've even run Mac Mosaic and TurboGopher over 4800 baud through the
gateway to see if it would work. (I opened up the security on the
gateway for a short time. :-) It was slow but usable.

How to do it is reasonably simple. Getting JNOS stable can be a pain
and really requires a fair bit of experimentation. Try different
flavours (JNOS 1.08dfd is supposed to be about the most stable at
the moment. See crompton.nadc.navy.mil) Memory is the most important
requirement though. I found my box became *much* more stable when

I switched to a NEAT chipset 286 and used QRAM to get 704k free under DOS and some UMB for the packet driver and other TSRs. Only compiling into the executable what you need so that the executable is smaller will help with memory problems.

Get an autoexec.nos from someone who has a stable system and minimally modifying that is a good way to start. I'm willing to post mine if people want.

A friend of mine restarts NOS every 6 hours. As he only uses it as a router to the outside world it doesn't affect his operation at all and it keeps the system going for weeks. This is a bit extreme though.

Once you have a reasonably stable version of NOS running you then either proxy arp as required or run the house network on a different subnet. In Canberra we have allocated a Class C address space to house networks. We have a couple up now and as there isn't too many machines it's not too hard to add proxy arp entries into JNOS so that we can 'simulate' standard class c addressing for the unix boxes and PC packages that can't handle classless routing.

I'd recommend Ian Wade's book, NOSIntro (I think the ARRL is stocking it) for beginners. It's a very good introduction into NOS.

Carl.

There is no simulator, I aksed this of the groundstation
controllers on Surry a few years ago. However, the protocol
document is readily available and there are a couple of other
programs now available to access the satellites other than PB/PG
(WiSP for Windows for example).

Hallo, All !
I'm Paolo, from Italy, and I'm searching a DRSI card that can be use with F6FBB packet bbs software.
It must have two port channel, without modem , and must operate at 38400 baud in both channel.
Here, in Italy, i don't found it....is there anyone that could give me any information about.
Thank you very much, and see you soon !!
Paolo

>a requirement for networking. Look inside a router from any of the major
>router manufacturers. You will find NON-preemptive scheduling, if you
>find much scheduling at all. Summary: TCP/IP does NOT require Unix.

Of course it doesn't, as long as all it's tasks are internal, look
at NET, NOS' predecessor, as an example. It's a fine router all by
itself, just don't ask it to work with separately compiled user
applications on the same box at the same time. Then you're looking
at TSR hell, locked or crashed machines, and poor performance at
best.

I can not believe that hams are still arguing about this. Brian, you must have made this same statement a thousand times in the past 10 years. It appears that still, no one is listening to you. It really is sad though. With the availability of Residential SLIP/PPP at 14.4K (it costs $27 a month here in the backwoods of NE PA) I find it hard to believe that anyone is still trying to do Packet TCPIP networks. I have had a connection between Packet and the University's LAN (and the INETRNET) for over 5 years. I am getting ready to de-commission it because it has outlived it's usefulness. Wireless LANs are old hat. What happened to hams pushing the technology envelope?? Why are we still arguing about how to do something that was solved years ago?? Some things will never change I guess. I'll go back to sleep and peek at this group in another 5 years.

Oh yeah. If someone can tell me about any NETROM wormholes running across the INTERNET using NOS, I will probably see if the local BBS guru wants to use my link rather than just turning it off.

All the best.

But a router is not an application support system - it's quite different.
A router has a small number of fixed tasks that can be made to have well-defined
dependencies on each other. The tasks are relatively simple, and most of them
are needed most of the time.

Applications are generally large, have diverse needs (dependencies on
filesystems, user, console as well as network) and suffer from considerable
design constraints if forced to poll for work not related to the current
thread (such as processing packet routing while doing a disc-bound operation).

So no, TCP/IP does not require Unix. In fact, I understand that Phil Karn
(who ought to know what NOS is good for, if anyone does) stopped adding
applications to NOS some time ago, and uses it as a router. He runs the
applications under Unix, which does a good job of it. This is especially
true where the system is primarily a server rather than an end-user's
node - an end user will tolerate slowdown on a background task while his
foreground task gets the attention. But where that background task is
someone else's foreground, or a network router, the compromise is
less acceptable.

MS-Windows _is_ a kludge : sales successes don't make that untrue.
But all engineering is a kludge in the sense of a compromise between ideal
design and economic necessity. Windows makes a trade-off that happens
to benefit Microsoft and the application developers more than it does
the users, but sufficient users are happy with that (because falling
hardware costs help compensate for the inefficiencies of a cooperative
multitasker) that the product sells.

>All that is needed is someone with the time to dedicate to doing this work.
>Perhaps someone could get permission to do it as a master's project or
>something.

Time _and_ inclination. Software is written for fun and/or profit : if there's no profit, it has to be fun. The number of people who are both willing to live within the constraints of DOS and write significant pieces of software for fun is, I think, falling rather rapidly.

The suggestion of an AX.25 driver and IP stack that provides an API to arbitrary applications has been made a number of times (including by myself). When I suggested it, the chief reason it wasn't useful was that DOS's memory management was too poor to permit usefully spawning multiple programs with differing lifetimes - i.e. there was a considerable advantage to having a single executable that did all the jobs you might require, despite the attendant disadvantages. MS-Windows has probably reduced those problems, but now many of the people who had the knowledge and interest to do the job have migrated to Linux or other Unix-like systems. It just isn't fun to spend more of your time fighting the limitations of the system than solving the real problem.

In short : it's a perfectly acceptable idea that suffers from a few limitations. If you want it though, you can't expect anyone else to do it for you - their time is just as precious as yours. So do it yourself.

1845. DSP Implementation of 16QAM schemes?

Newsgroup: rec.radio.amateur.digital.misc

From: nlaw@aztec.co.za
Message-ID: <2t2kfu$sqh@ticsa.com>
Source record: 48838

Hello All

I am looking for information on whether it is possible to implement a
16QAM (or TCM) modulator and demodulator at a raw data rate of 64kbit/s
and greater (128kbit/s), using a DSP.

The intended application is for a fixed, point-to-point, digital radio link.

I would appreciate any info, or references to someone who may know more
about this field.

Thanks in advance.

Perhaps "letter" is a misnomer. But you did post an article dated March,
1992. I've appended it to the end of this posting as I found it in our
PBBS archives.

>Indeed, a TCP/IP network *isn't* bad, and it *does* handle SMTP, FTP,

>NOS makes a fine router to get it on the radio network.

Aye, but that's the hitch, isn't it--preaching the gospel. :-) I've been
doing just that (BTW, thanks for clearing up my misconceptions about NOS.
I'm a lot less "down" on it now).

>Yes, a powerful search agent is much more efficient of network bandwidth
>than randomly downloading the directories of every server on the network
>looking for a file topic. But to make that interpreter work, you really
>need a multitasking OS, otherwise you kill that node's network activities

>packets instead of running your application. Or conversely, it'll spend
>it's time in your application and fail to respond in a timely manner to
>a packet addressed for your machine and cause unnecessary retries on the
>limited bandwidth network. Pre-emptive multitasking is necessary to deal
>with the competing demands of network and application.

I'm planning on implementing this under Linux, soon's I get a box. Mean-
while I'm working on it on a NeXT I have access to. But I'm being hampered
by a few things:
1 I prefer to work in C++ but YACC likes C. Not much of
a problem though.
2 I've never written *any* sort of programming language,
much less a compiler/interpreter. Again, a minor
drawback, but I can handle it.
3 I'm definitely *not* a computer programmer. :-)
4 I'm working 2 jobs at the moment.

But I'm working on it! It just might take a while (so if there's anybody with more of a clue about what they're doing who wants to get in on it, please feel more than free to contact me).

And now, this is the original posting by KE4ZV to which I referred in my initial post.

>get very far.

I doubt that you are very far behind the US in *applications*. It's hard to be *far* behind zero. This is the major problem facing packet in the US. Aside from Packetcluster DX spotting systems, and the BBS Email and bulletin systems, there are practically zero *applications* of packet radio.

We have proven high speed hardware, proven networking software, and fair connectivity in local areas, but we don't have anything to *do* with packet radio. The vast majority of users have remained at 1200 baud on simplex 2 meter channels because there isn't enough to *do* with packet to require them to upgrade to faster channels and better modulation schemes.

>Questions.
>
>How will we get around the junk (ie articles of no interest but to the
>sender, or telling you not to miss a contest that has already
>finished because the message took two weeks to get to the BBS) BBS
>mail problem ?

Short expires. If that doesn't work, use shorter expires. Ideally precedence fields should be implemented to indicate to the systems how to handle the message, and when and if it should be thrown on the floor.

>How will TCP/IP influence future systems ?

Because the implementation we have is totally open, it has attracted
a lot of interest among the code hackers. Potentially it opens the
way for unlimited applications, but as a practical matter because of
the monolythic way it's implemented on DOS machines, it's turning into
a complicated way to do a BBS and ship a few files. It's actually an
impediment to new applications at this time. It's best use now is
as a switch node in the trunk network and as a gateway to a capable
multitasking system with native TCP/IP (ie a Unix box). Before TCP/IP
can have a significant impact on packet, we've got to abandon DOS
or rewrite the code to act as a device driver accessable to *any*
program running on the system.

>Is DSP going to be affordable in the near future ? What advantages will it
>bring in terms of speed, overcoming interference, spread spectrum ?

As prices drop for DSP hardware, as most everyone expects it to do, there
will be a proliferation of software modem designs available for the down-
loading. That's going to obsolete the hardware multimode boxes like the
KAM, PK232, MFJ1278, G3RUH daughter boards, PSK pacsat modems, etc.
While it's unlikely that speeds will increase above 9600 baud using DSP
in the near future, certainly more efficient and more noise and interference
tolerant modem designs will be forthcoming. Because it's "only software",
users will upgrade quickly. DSP probably won't have an impact on spread
spectrum techniques in the near term, too much horsepower is required to
do SS in software.

>Why are some people so anti-packet (I need to get at the hecklers!), is it
>because they don't understand it, own the spectrum it uses, or another
>reason ?

Yes. :-)

There are a variety of reasons people are hostile to packet. The number
one thing that I hear is "it's not *real* radio because it doesn't take
any skill to use it." That comes mostly from the CW forever crowd, and
a little bit from the paper tape RTTY crowd. The second most common
complaint is "there's nothing to *do* with it." And the third most
common complaint, not from the CW crowd, is "it's so slow."

Packet *is* the fastest growing mode in amateur radio since the advent
of SSB, so there is interest in it out there. But many people quickly
become disenchanted with it because it is slow and booooorrrring. We
have hardware to fix the slow, but we haven't yet solved the boring.

>Any help would be appreciated. I already know how I think packet will
>develop, but I would like to know others views.

I've mostly dwelled on the problems of packet above. What I'd like
to see in the future is a more fully connected network operating
at a high enough speed and with proper networking software so that
distributed computing can become a reality. I'd like to see multi-
player, nulti-computer games. I'd like to see distributed databases

so you could send a demon out into the network to run down practically any fact you might want to know. I'd like to see cooperative massively parallel systems evolve that can take a problem handed to the network and divide it up among many machines for rapid solution. That's where I would like to see packet go, but I *expect* it to fall into a 1200 baud and C64 forever mindset that never reaches the heights it is capable of scaling. I guess I'll be happy if we can just reliably deliver the mail to a mobile user outside his home LAN.

The following is posted from comp.networks.noctools.tools newsgroup:

NAME
ethernet-codes

KEYWORDS
reference;
ethernet, fddi;
;
;
;

ABSTRACT
Mike Patton of MIT LCS has compiled a very comprehensive list
of the IEEE numbers used on Ethernet and FDDI (with some permutation).
This file contains collected information on the various codes used on
IEEE 802.3 and EtherNet. There are three "pages": type codes, vendor
codes, and the uses of multicast (including broadcast) addresses.

MECHANISM
FTP the file and use it like a secret decoder ring.

CAVEATS
Since this information is from collected wisdom, there are certainly
omissions.

BUGS
Mike welcomes any further additions.
They can be sent to a special mailbox that he has set up:

MAP=EtherNet-codes@LCS.MIT.Edu

LIMITATIONS
See caveats.

HARDWARE REQUIRED
No restrictions.

SOFTWARE REQUIRED
No restrictions.

AVAILABILITY AND CONTACT POINT FOR INFORMATION ABOUT THIS TOOL
The file is stored as flat, non-compressed ASCII text.
It can be FTP'ed from:

ftp.lcs.mit.edu

Retreive the file:

/pub/map/EtherNet-codes

To submit additions or obtain further assistance, send email to:

1852. Reed-Solomon S/W

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-08 03:20:05 UTC
From: robbomas@aol.com
Message-ID: <2t3dd5$c3v@search01.news.aol.com>
Source record: 48742

Has anyone explored the possibility of using Reed-Solomon codes for error detection/correction? These are powerfull codes that are used in Compact Disc audio players.

Here are some thoughts:

1. They excel at correcting bust type errors. Should be good for fading and interference, especially when combined with interleaving.

2. The should also be somewhat (?) easy to decode since thay have a cyclic structure. One approach would be to divide the received codeword by the generator polynomial to obtain a syndrome polynomial in much the same way as is done for CRC detection. Then, instead of the complex algorithims usually associated with find the error locations, one could (?) use a table look-up to find the error positions.

3. One drawback is that in order to get a high code rate (less overhead) one needs to use more bits/symbol which results in a long code words.

Anyway, I just thought I'd toss this idea up. Maybe someone knows of existing software that could be used in simulations or in over-the-air testing.

1853. Baycom software ftp site? FAQ loc.?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-08 04:23:50 UTC
From: un107332@wvnvms.wvnet.edu
Message-ID: <1994Jun8.002350.10628@wvnvms.wvnet.edu>
Source record: 48745

I need to know where I can ftp the Baycom software from .. also,
is there an FAQ for this group? I looked through past articles and didn't
see it ...did I miss it? If there is one, and it just hasn't been posted,
can someone post the ftp site to get it from if it is archived?
Thanks,

Laurent
p.s. Does anyone know if there are any packet modems that handle regular
data, with phone line, as a regular modem? And has anyone done anything
with the idea of using a Soundblaster as a packet modem?

doesn't it?

>Aye, but that's the hitch, isn't it--preaching the gospel. :-) I've been
>doing just that (BTW, thanks for clearing up my misconceptions about NOS.
>I'm a lot less "down" on it now).

Yes, NOS is a remarkable piece of code for us to play with. It's not what
we ultimately need, but it's what we've got, and it's useful as is. The
trick is to get the user community out of the TNC and glass TTY mindset
and into the possibilities for open computing that a packet network can
offer. That requires applications beyond keyboard chatting and BBSs.

>>Yes, a powerful search agent is much more efficient of network bandwidth

You might want to check out _Threaded Interpretive Languages_ by
R.G. Loeliger for an idea of how compact and efficient a small
interpreter can be. C and yacc are useful tools, but I think that's
the wrong approach to developing agents for small distributed systems.
You need a core of about 500 bytes of assembler, and the rest done in
the threaded language itself with appropriate hooks to OS calls. The
whole thing should be in a protective wrapper that accepts foreign
requests to present to the interpreter and which sets permissions
so errant programs can't cause mischief.

>of the more advanced things, that is the result of THEIR DECISION.

To what in amateur packet radio are you referring to as "state of the
art" or "advanced"? (I really can't think of anything; even the fastet
packet stuff we have (around here anyway) is based on 70-80's
electronics and technology)).

In any case, I think I understand your underlying sentiments: the fun
of the hobby is mainly in the learning and doing, not in the
geee-whizz factor of buying the latest gagdets. If people just want
to buy expensive equipment without having to learn anything, they
should pick another hobby, like buying high-end 'audiophile' (tube
amps and $200 speaker cables) type electronics to blow their money on
without the pain of having to learn.

TCP/IP packet takes some time to learn; if people don't like that they
can sign up with America Online if all they want to do is chat.

From: johna@icsbelf.co.uk
Message-ID: <Cr2u8v.10y7@icsbelf.co.uk>
Source record: 48755

Hi All,

Thanks for reading this. Does anyone know if a version of WA8DED firmware
is available for use in a TNC-2 - specifically a Paccom Tiny-2 ?

I have the eprom images of WA8DED for a TNC-1, but I cannot see how this
can be used with a TNC-2.

If WA8DED firmware is available, is it on an ftp site somewhere ?

Thanks in advance ....

Loeliger is a useful book for explaining the concepts, but I'd have
thought a ground-up Forth interpreter including the machine-coded
primitives was a bit _too_ low level for this sort of thing, if only
because it makes the interpreter unnecessarily machine-dependent.
I appreciate that the primitives can be re-implemented in other
hardware's code, and that the actual language would be processor-
independent, but a C-based interpreter such as tile forth seems
a more convenient place to start.

Other interpreted languages with good string-handling functionality
and extensibility such as perl or lisp might also be useful.

For a much lower-level approach, there seems to be some work in
progress on protocols that are implemented in the packets (or
'messages') themselves, rather than in a fixed protocol definition
that's understood by each end. My limited knowledge of the German
Flexnet system (I don't recall having read a detailed description
of it) is that it works this way, and a forth-like interpreter
for a system called M0 has just been posted to comp.unix.misc.
FTP it from cui.unige.ch:/pub/m0 if you missed it - it has both
Unix and DOS implementations.

So let's start bouncing some more applications around here. The tech-
nology we're working with may not be the absolute latest, but even on
the Internet it's only been the last two or three years IMO that it's
really started to take off application-wise--namely with the advent of
such things as Archie, Gopher, WAIS.

Hrm. I'll take a look around for it. I'll probably still write it in
C--I'm not all that familiar with assembler and I am with C, but I'll
definitely look for the book. BTW, you wouldn't happen to have the ISBN
number, etc. for it? It'll make it a lot easier for me to find. :-)

>keep up with everything then I'd need to stop working...and then how
>would I pay for all this state of the art stuff :(

How about if we just expect people to keep within some distance of the
leading edge of the state of the art, a distance based on what their
expectations of it will be. You know you can't get 1200 baud from your
Morse Code key, so you don't try and you don't expect it. That key is
way back there from the leading edge but we still have them (I have 2).

There is nothing wrong with keeping any old level of technology and even
using it. The point is to not expect everyone else who prefers to move
on to new and better things to hold back for you. There are ways to deal
with such things, such as a 1200 baud AX25 2m FM node that gives whoever
connects to it a telnet "shell" to get into the higher speed TCP/IP nets.

Life is supposed to be a continual learning experience. Those who decide
to stop are, IMHO, dead.

I spotted a msge from the author (VK2DHU?) on our local BBS recently. He mentioned that he recently released paKet 6, and said that packet radio forwarding has broken down in his part of the woods, so you may have to contact him by snail mail. Paket 5.1 is a nice package, that supports most TNCs in standard mode. Useful features are YAPP binary transfers with the possibility of resuming after a link failure, and full, hands off up/download support for the BayCom/SP binary transfer protocol. I haven't seen version 6 yet, no mention was made of new features.

Cheers,

Wilbert, ZL2BSJ.

|> >It has to maintain state, it has to have various timers running, and
|> >it has to do link level address resolution via the arp agent....
```

I've modified the etherslip packet driver to do this in the simplest case: the Ethernet frames sent from the TCP/IP stack get converted to AX.25 UI frames, encapsulated in KISS. ARP is handled by the stack, with the packet driver mapping AX.25 addresses into pseudo-Ethernet addresses.

It should be possible to put the whole AX.25 protocol into such a driver, or even better create a separate AX.25 packet driver that could use another packet driver to run the hardware. I haven't gotten motivated yet to try it.

The biggest limitation so far is with the TCP/IP stacks I've tried. They generally have some hard coded assumptions about round-trip times, or ARP or name resolution that don't work well over slow, lossy radio links. There's also not the same level of status and manual control that NOS provides. I'd like to think those limitations can be overcome one way or another. The current crop of DOS and Windows applications are just the thing for a packet radio client-only user.

```
|> Windows is not at this stage a kludge or bandaid to DOS.
```
Well, it may be popular, powerful, and useful, but if you look under the hood, Windows stands as a monument to the gods of Backward Compatibility and Kludge.

1871. Atari 800 packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-09 04:43:34 UTC
From: un107332@wvnvms.wvnet.edu
Message-ID: <1994Jun9.004334.10633@wvnvms.wvnet.edu>
Source record: 48760

I saw someone made a post about using an Atari ST for packet in
r.r.a.misc (it was a question, not info on how to do it ..).
I have an Atari 800 and 400 sitting around, and a Baycom kit I've
been planning to use with an old 8088 PC whenever I build it.
Has anyone written Baycom software that would run on an Atari, and
is there a way to connect the Baycom to an Atari?
Thank for any information,

Laurent

1872. fax freq's

Does anyone have any freq's for WeFax, or NOAA Weather Maps?
Could you please mail them to me at brixius@icicle.winternet.com

1873. Vester SSTV modulator

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-09 08:29:29 UTC
From: jeff.smith@n9csa.com
Message-ID: <940609170143791@n9csa.com>
Source record: 48774

Hey Guys,
Does anybody know where I can get a ready-made Vester SSTV board? It is featured in QST Jan. 1994. Or does anybody want to make it for me for cash? Let me know at this address.
Thanks, Jeff Smith

1874. Any good trades for AOR2800 1000 channel Scanner?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-09 08:39:58 UTC
From: ronh@pacifier.rain.com
Message-ID: <Cr4G2o.7JI@pacifier.rain.com>
Source record: 48764

********For Sale********
****AOR2800 Scanner****
Wife says I have to many toys, So, I must say
goodbye to some of it for cash. (I guess she
wants to spend some of our money too!) :)

This scanner was purchaced from Ace Communications
1 year ago, for $449.00 plus shipping. It is in
mint condition, and has everything it came with,
except the box. (Wasn't that great of a box anyway!)
Selling price: $325.00, I pay shipping.
Terms: Money Order or Cashiers check ships same day
Personal check must clear first. No COD.

Trades: May be interested in NEWER computer periphials
or components (NO 8088, 286, or 386SX16 junk please!)
All mode TNC, Misc. Ham gear (Keyers, paddles, Antennas
etc.) These may be partial trades with cash, or full.

Features:

AM, NFM, WFM, SSB w/BFO
Coverage; 500KHz-600MHz 800MHz-1300MHz
Sensitivity: .35uV Narrow FM
1.0uV Wide FM
1.0uV AM

Step Increments; 5-995KHz

1000 Memory Channels
1000 Search Channels

This unit works flawlessly, and is guaranteed against DOA
Does HF Ham bands and SW Great! (If you are wondering why
the cut-out between 600MHz and 800MHz, it is to prevent
front end overload from strong TV stations, which is the
only thing you mis by not having those frequencies)
Comes with manual, Antenna, Power supply and a nifty acrylic
desk stand, and a cigarette lighter plug.

If interested, send E-Mail to ronh@pacifier.rain.com

Well, Gary, I'll bet you never dreamed that this one would come back to haunt you. However, your foresight seems better than most folks hindsight. Maybe we need to resurrect more of your articles and review your prophesies once every year or so. It would provide a good barometer of amateur radio progress in high-volume wide-area messaging systems.

You only missed foretelling one item, far off-point anyhow, and that is that Commodore went under earlier this year and is currently being liquidated. That should aid the demise of "the 1200 baud - C64 forever mindset" that you made reference to in your closing paragraphs.

And last, I think you have at least tied the record formerly held by Dan Pickersgill N8PKV for having your name appear in a rec.radio.amateur newsgroup subject line for the longest number of consecutive days. Add that to your new job title "E-Mail Elmer" that we bestowed upon you a few days ago!

Those are good applications, but they are bandwidth hogs. That's why
I push the idea of intelligent agents. One application of the net is
to use it as an extended database, so search agents are an important
first application. The net can also be a distributed computing resource.
Agents take advantage of this in a limited way, but many other applications
can also make use of the ability to farm out compute chores to available
systems. This can start with dedicated "compute" servers, but eventually
we want to be able to tap into any idle cycles of any system on the net.

An example of a dedicated compute server we might want to build is a
machine that can return orbit data given a satellite name and range
of times over which pointing data is required. Right now, everyone
has to run a orbital prediction program on their own machine, but
it would be useful to be able to farm this chore out to machines
with greater number crunching horsepower and allow your user machine
to devote it's cycles to other tasks.

Another example of a distributed computing environment is a foxhunting
varient of APRS where each machine in the network calculates parts of
the target solution and forwards it to the other machines so that a
complete solution can be rapidly found.

Sure ISBN 0-07-038360-X. There are likely better ways than this
available now, but the idea of compact interpreters is valid.
Forth is particularly attractive as an agent language because
complex programs can be expressed in only a few words over the
network. Our network has limited bandwidth, and is chaotic in
structure, so self-navigation and low bandwidth consumption
are primary attributes of good network applications.

1880. PAKET 5.1

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-09 17:11:40 UTC
From: wb7cky@vnet.ibm.com
Message-ID: <Cr53rG.3K95@austin.ibm.com>
Source record: 48771

Several of us here in Tucson have stopped using PAKET 5.1 because it seems to have a difficult time coexisting with BBS's that forward messages in a compressed format. PAKET will switch from user 1 to 2 to 3 and to 4 while in MONITOR mode. I was surprised that all of that non-ASCII data would have an affect on the program but it apparently does. Everything is great until the BBS's start their forwarding and then all heck breaks loose. I can be watching the monitored data in the first window and then suddenly nothing is happening except that I can see the counter for one of the other windows start stepping up indicating that window has nn bytes of unread data. Has anyone else experienced this?

Unless errors are very frequent, error polynomial solution time isn't really that important. What *really* matters is the speed of the encoder / decoder, and long polynomial shift registers tend to be pretty slow when done in software. In any event, unless you're using relatively short (less than 8 bit) codewords or not a lot of redundancy, the tables get large quickly. Also, the one and two word error equations aren't that bad, really, assuming your up on Galois vector extension fields (and have a nice math package like Maple).

>3. One drawback is that in order to get a high code rate (less
>overhead) one needs to use more bits/symbol which results in a long
>code words.

That's only bad if you're using table solutions, or if long blocks won't fit in between fades (on HF) or in a burst (for meteor burst systems).

>Anyway, I just thought I'd toss this idea up. Maybe someone knows of
>existing software that could be used in simulations or in
>over-the-air testing.

Well, have a look at ecc1.2.1, which is available from any Free Software Foundation site. It implements the (255,249,7) Reed - Solomon code (three byte errors corrected in a block of 255 bytes). The encoder and decoder are implemented as shift registers, and the error correcter is an implementation of the Peterson algorithm.

Oh, um, yeah, I'm the author.

From: jpll@vectorbd.com
Message-ID: <Cr5GJC.7tu@vectorbd.com>
Source record: 48779
Cross-posted to: rec.radio.amateur.digital.misc,comp.dsp

After days of a few of us new owners struggling to get our C50 DSK's going, we decided to call TI. The tools worked OK, the Loader alone did not.

It seems that that EXE was compiled under OS/2 and will not run under "plain" ms-dos.

Jason Chyan advises that a new EXE will be on the TI BBS in a "few weeks".

Oh well.....

Greetings, Albert.

KB: Kristoff Bonne (kristoff.bonne@piressys.belgacom.rttipc.rtt.be)
AW: Albert S. Woodhull (awoodhull@hamp.hampshire.edu)

KB>> I've put NOS on a PC at my qrl to do some tests on the LAN.
...
KB>> When I send/receive 'a lot' of data ('a lot' being some hundred bytes), the
KB>> session hangs. (the rest of NOS still works OK?)

AW> I suspect the problem may be that NOS does dynamic memory allocation and
AW> just can't do it fast enough to handle a large amount of data coming in fast,
AW> i.e., at ethernet speeds. Try using the "mem stat" command after this happens.

You were right that the problem was actually a memory problem.

Increasing the 'mem ibufsize' to 1024 resolved the problem.

Thank you for your help.

BTW: Did you receive my message from UseNet (if yes, which one?) or from the 'ham-digital'
mailing-list at ucsd.edu?

Shareware RTTY/FAX Decoding Programs for the IBM PC

Frequently Asked Questions

by Dave Moisan, N1KGH

Last Revised--28 November 1993

Many people have gotten interested in receiving RTTY and FAX transmissions with their PC's. Shareware, combined with cheap, easy-to-build hardware, has put RTTY and FAX reception in reach of anyone with a good digital portable such as the Radio Shack DX440 or Sony 2010.

Two programs have become very popular: Hamcom 2.2, a RTTY terminal program, and JVFAX 6.0, a full-featured FAX/SSTV receive program. The two programs both use an identical basic interface, so one can get started in FAX and RTTY for almost nothing. Another program, PKTMON, lets you monitor HF and VHF packet off the air, using the same hardware.

This FAQ list is divided into five sections:

Introduction
Using HamComm
Using JVFAX
Using PKTMON
General Problems

Appendix--HamComm Interface Schematic and Parts List

INTRODUCTION

** Where do I get the software?

HamComm and JVFAX are available from a number of sources on the Internet, including the Simtel mirrors (such as wuarchive.wustl.edu) and nic.funet.fi (/pub/ham/misc); look for HAMCOM22.ZIP and JVFAX60.ZIP. PKTMON 1.2 is available from nic.funet.fi.

Note that HamComm 2.2--unlike earlier versions--is no longer freeware; registration is $20. It's still a bargain.

** What are the basic system requirements?

HamComm: Fast (8 MHz) XT or better, 320K free RAM, hard disk not required.

JVFAX: 286 or better, at least 1M RAM; a hard disk is
strongly recommended. Note that JVFAX has its
own extended memory driver, which might conflict
with QEMM and other memory drivers. (Version
6.0 *does* work with HIMEM.SYS, however.)

Pktmon: 286 or better.

** What are the basic receiver requirements?

I've successfully received RTTY, fax and Packet with my
Radio Shack DX400 digital portable, and have had less
luck with CW. Receivers like that will work, but table
top radios (Kenwood, Icom and Yaesu) and ham transceivers
are much more suited for this application.

** Where can I find plans for the basic interface?

The plans are included in the documentation for both Hamcom and
JVFAX. JVFAX has schematics for both the basic interface, and
a more sophisticated interface that also receives GOES/APT
satellite pictures.

A complete schematic and parts list is included at the end
of this FAQ list.

** I don't want to build it. Can I buy a interface?

Yes. William Nolle is selling his version of the interface,
called FAXCAP, and it includes all software discussed here.
Contact him at:

William Nolle
122 Phillips Rd
Hazel Green, AL 35750

(Disclaimer: I am not affliated with William, nor am I even
a customer, but merely a friend and fellow enthusiast.)

Also, Dieter Dippel is selling an interface (with surface-
mount components) which includes JVFAX and HamComm. Contact:

Dieter DIPPEL, DF4RD
Fenitzerstr. 33
D-90489 Nuernberg
Germany

Phone: (049) 911 / 55 92 96 between
18:00 and 20:00 german local time or at weekends.
(1700-1900 UTC)

Email: UNRZ45@daphne.rrze.uni-erlangen.de

** How does the interface work?

This is a zero-crossing detection circuit, made up of a 741
connected in an open-loop configuration. For every zero-
crossing (twice a cycle), an interrupt is generated.
HamComm measures the time between successive interrupts using
the PC timer chip.

** How do I connect it to my radio?

Simply run an audio cable from the interface box to the earphone/
headset output, record output, or data output of your radio. The
Sangean 803A has a record output, and the DX440 can be modified for
same. Note that the interface needs 100 mV of audio to work,
but most rigs can easily supply this.

** Can you transmit with the interface?

Depends on the software, and how you construct the interface.
Hamcomm will send through the speaker or TxD line of the serial
port; JVFAX sends through the speaker (and the TxD line starting
with version 6.0.) Pktmon doesn't transmit at all. See the
appendix for details.

USING HAMCOMM

** How do I set up HamComm?

There's a sample configuration file in the HamComm archive, HC.CFG
which explains the numerous parameters required for the program
to run. Here are the ones you should set:

select port com<n> (Select default com port, <n=1 to 4>)

Note: COM1 and COM2 are already defined. If you need to
use COM3 or COM4, here are the "define port" statements
to use:

define port com3 iobase 0x3e8 irq 4
define port com4 iobase 0x2e8 irq 3

You don't need to do this for COM1 or COM2 unless you have
an unusal setup.

If you want HamComm to keep time in UTC, include these two lines:

set timezone UTC
set timediff 7200

The timediff parameter is the time difference between UTC and
your local time (UTC minus local), in seconds. In the
example above, timediff is set to account for U.S. Eastern Standard
Time (-4 UTC).

There are many other configuration options, all explained in
HC.CFG.

** Where can I find RTTY on HF and what does it sound like?

The ham bands are the best place to find decodable RTTY. I tune into CFH, Halifax, Nova Scotia on 4271, 6496.5 and 10536 KHz. RTTY is usually sent on the half-hour. RTTY has a "deedle-deedle" sound that you're probably familiar with if you've ever randomly tuned the shortwave bands.

If you want to know what an RTTY signal sounds like, go to the RTTY screen (F3) and try control-T (transmit on/off). Type in some text and hit ENTER. You will hear a signal from the PC speaker according to the currently selected speed, shift and center frequency.

** How do I tune RTTY?

First, hit F9 for the tuning screen and, using the arrow keys, set the center frequency to 1200 Hz. For example, if you're trying to decode the ARRL bulletins on 3625 KHz, the tuning screen should look like this:

Signal Frequency: 01### Hz

0 . . . .500 . . . .1000 . . . .1500 . . . .2000 . . . .2500 Hz
Space -> | | <- Mark
|

Center Frequency: 01200 Hz

Using the arrow keys, move the lower tuning bar between the two upper tuning bars. You may need to vary your BFO, RIT or clarifier so that the upper bars are centered on the display.

The difference between the two frequencies, or "distance" between the two upper bars is the *shift* of the RTTY signal. Hit Alt-K and select the appropriate shift--in this example, 170 Hz.

You'll know when the signal's tuned properly, because a train of square waves will appear at the bottom of the screen.

Next, hit Alt-S and select the *speed*; Ham RTTY is usually 45 baud. Outside of the ham bands, 50 and 75 bauds are most common

In HamComm 2.2, you can use the Bitlength Histogram screen to measure the speed. Hit F6--the baud rate will be indicated on the upper bit display. You won't get an accurate count on very noisy signals, however.

Note: If you're mathematically adept, you can figure out the speed yourself. Hit F8 to select the Scope and freeze the display by hitting Return. Measure the time interval of the _shortest_ peak, and calculate Baud rate = 1/t*10**-3, where t is in milliseconds.

Now, hit F3 (for Baudot), and readable text should scroll forth on
the screen. If it doesn't, hit the Tab key to toggle between
Normal and Inverted keying. If text is still unreadable, hit Alt-S
and adjust the speed.

** How do I log RTTY to a file?

Hit Ctrl-F; select the directory or file you want to save to and
hit Return. To stop logging, hit Ctrl-F again.

Here's some RTTY recorded off the air on 4271 Khz (at 0230 UTC):

avalon peninsula
east coast the bonavista peninsula only.
freezing rain warning continued for the bonavista peninsula only.
tonight..overcast. intermittent drizzle or freezing drizzle.
periods of freezing rainpm yrkwivonavista peninsula ending
overnight. winds becoming strong northerly. low zero.
friday..cloudy. patchy freezing g7+)-01vtov

** Whenever HamComm is receiving a string of numbers (like
from CFH or other weather stations), it comes in garbled.

First, turn off the Auto Unshift feature by hitting Ctrl-L;
the "L" annunciator on the bottom right of the screen should turn
off.

HamComm 2.2 has a weather broadcast mode that will automatically
decode weather synop broadcasts--the string of numbers you may
have seen. Here's a sample, again from CFH:

17:45:50 UTC end/tcf
17:45:52 UTC xxxxx 142346z
17:45:55 UTC snvd17 cwhx 142300
17:45:57 UTC bbxx [SHIP]
17:45:58 UTC 44139 [ship id]
17:45:59 UTC 14231 [day:14 UTC:2300] [Wind speed obtained from
anemometer (m/s)]
17:46:00 UTC 99443 [latitude:44.3]
17:46:00 UTC 70573 [longitude:57.3] [Latitude south, longitude west]
17:46:01 UTC 46/// [automatic] [cloud height:no data] [visibility:no data]
17:46:02 UTC /2809 [cloud cover:no data] [wind dir:280 deg, speed:9]
17:46:02 UTC 10092 [air temp:+9.2]
17:46:03 UTC 40075 [pressure at sea level:1007.5hPa]
17:46:05 UTC 57014 [pressure:decreasing] [change in 3h:1.4hPa]
17:46:05 UTC 22200 [ship direction: stationary, speed: 0 knots]
17:46:05 UTC 00082 [sea-surface temp: +8.2]
17:46:06 UTC 10805 [wave period:08 seconds, height:2.25-2.75m]
17:46:07 UTC 70023 333 [section 3]
17:46:08 UTC 91211
--- log closed Sun Nov 14 1993 18:02:36 UTC ---

(In the above example, note that the latitude is reversed
between north and south; this is a known bug.)

Hit Alt-T Y to decode SYNOP reports. Alt-T I decodes SHIP
format reports. HamComm will automatically recognize incoming reports
(prefixed with "aaxx", "bbxx" or "zczc" headers), but the Alt-T
commands are useful when you want to decode in the middle of a report
without waiting for the next one.

** I found RTTY, but Hamcom can't decode it.

A sad fact of life in the shortwave bands is that at least 3/4's
of all RTTY is encrypted, and alas, much of the unencrypted
traffic is not sent in plain Baudot. There still are many
decodable signals, but you'll need good references to find them.

** How do I decode CW?

Decoding CW is similar to decoding RTTY, except that there's only
one frequency to be concerned with. While you hear the CW,
go to the decoding screen, as below:

Signal Frequency: 01200 Hz

0 . . . .500 . . . .1000 . . . .1500 . . . .2000 . . . .2500 Hz
|
|

Center Frequency: 01200 Hz

Just move the arrows so that the lower line is lined up with the
upper and hit F2.

Here's a sample of CW copied off the air, on 4281 Khz

vvv vvv vvv cqde vcs vcs vys qsx 4 6 and 8 mhz chnl 3/4/7/8 vvv
vvv vxv cq de vcs vcs vcs qsx 4 6 and 8 mhz chnl 3/4/7/8 vvv vvv
vvv cq de vcs vcs vcs qsx 4 6 and 8 mh7 chnl 3/4/7/-.--.. vvv
vvv vvv cq de vcs vc5 vcs qsx ......- 6 und 8 mhz chnl 3/4/7/8

Note that HamComm subsitutes dot-dash marks for any character it
can't decode.

** I'm hearing CW, but Hamcom just garbles it.

There are two different problems encountered with CW decoding in
HamComm. Here's what Django, DL5YEC, author of HamComm has to say:

Problem 1: Tone detection

For many people it is obvious that an RTTY signal has two states,
usually called mark/space or high/low tone. ANY data
transmission requires at least two states for 1 bit at a time and
CW is no exception. So what are the two states for CW? They
are the tone and ... NOISE ! You may be surprised to hear that
a certain amount of noise is REQUIRED to detect that the tone
has ended.

HamComm has an indicator for the tone detector output. At the bottom of the RX window, just to the right of the WPM display, is a small white dot that jumps up and down: up = tone detected, down = no tone (noise) detected. Listen to the signal and watch the jumping dot. It should follow the signal precisely and not jump around nervously or stick to one position.

The input signal is compared to the currently selected mark/space tones. To be regarded a valid tone the signal has to stay in that range for a certain amount of time. So the behaviour of the detector mainly depends on the currently selected SHIFT.

The tone detector output as displayed by the dot is the input to the character decoder.

Problem 2: Character decoding

In theory a dash is three times as long as a dot, the gaps within a character are dot-sized and the gaps between characters are dash-sized. In reality there are short and long tones and gaps of variable size because CW is usually 'hand-made.' The speed and length ratios also change during a transmission if the operator gets tired.

HamComm keeps a floating average of the tone duration to adjust to speed changes. Overall decoding quality mainly depends on the tone detector.

As an aside, I should mention that the bouncing-dot display also works great for RTTY; just tune the receiver until the dots bounce equally between top and bottom.

** Are there any reported bugs in HamComm?

As noted earlier, HamComm 2.2 has a bug in the WX decoder where the position reports are reversed from north to south in quadrants 5 and 7.

The "send text file" function transmits some text twice when in WORD mode.

USING JVFAX

** How do I set up JVFAX?

Select "Configuration" from the menu, and you should see a Config screen. Options are set using the arrow keys to select, and the space bar, - or + to set each option. Here are the options you need to set:

Demodulator: Set to "8 bits" and "Comparator". Specify the address and IRQ according to the following table:

For: Specify IRQ: and Address:
---- --- -------
COM1 4 03F8

COM2 3 02F8
COM3 4 03E8
COM4 3 02E8

Graphics and SSTV-Graph: Set this as appropriate for your system.
Most users can specify "VGA (640x480)". If you've Super VGA, see
the next paragraph, otherwise skip ahead to "Printers".

Configuring Super VGA: You'll have to choose between 16-color SVGA
and 256-color SVGA; the latter is required if you intend to view
false-color weather pix and for resolutions higher than 800x600.

Under the menu "Customising SVGA Parameters", complete the following
items. I'll use my elderly Trident card, set to 640x400x256,
as an example.

Chipset (256-color only): Select the name of the chipset in your
SVGA card (usually in your SVGA card manual).

AH/AL: Enter the register value for the video mode you want--this
can be found, again, in your SVGA card manual. In my case, I want
640x400x256 which is mode 5Ch, entered into AL.

BH/BL: Some SVGA cards, particularly VESA-standard cards, require
this register pair as well. My card doesn't use them.

Dots Per Line:
Number Of Lines: Self-explanatory. For my Trident, I enter 640 and 400
for the values.

Aspect Ratio: This is normally set to 10000 for standard (3:4 aspect
ratio) screens such as 640x480, 800x600, etc. It is calculated with
the following formula: (Lines/(Dots * .75))*10000. My Trident is
slightly nonstandard, so my aspect ratio is:

(400/(640*.75))*10000 = 8333

The JVFAX documentation lists settings for many popular cards.

Printer: Again, set this as appropriate for your system. Most
popular dot matrix printers and the HP Laserjet are supported.
(As an example, for my Panasonic 1124, I selected "Epson 24-pin".)

Enable scrolling: This determines whether faxes will scroll
off the screen when being received. Set this to "Yes".

Default Picture Directory: Enter the disk and directory where
faxes will be stored, e.g. "C:\WEFAX".

Store Pictures in GIF 89a: JVFAX uses the GIF 89a standard to store
special information on each fax, such as mode, LPM and IOC. Unless
you're using other GIF software that can't handle this standard,
leave this enabled ("Yes").

Miscellaneous Settings: Hit Esc to enter yet another configuration menu. There are just a few settings you need to make:

Quicksave: This feature lets you save the last picture sent; it works by continuously capturing faxes to a .GIF file, which may become *very* large. Unless you have lots of hard disk space, set this "off".

Initial RX Mode: Set to "1--Wefax 576"; this is the mode that almost all weather faxes are sent in.

Disable XMS use: Set to "No". Normally, if HIMEM.SYS is loaded by DOS, JVFAX will use it to manage memory. With some DOS/BIOS/hardware combinations, this may cause problems (blank pictures, lock-ups, etc.) so you may need to disable XMS (set parameter "Yes"). This will degrade JVFAX's performance so leave this alone unless you are actually having problems.

Hit Ctrl-Enter to leave this menu. Hit Ctrl-Enter again, and you're done!

** Where do I find fax and what does it sound like?

A Fax signal will have a "scratchy wheel" sound when sending a picture, and a carrier tone when idle. It can be found easily in the maritime bands. Unlike RTTY, there are few variations, and no transmissions are encrypted that I know of.

Two stations I hear regularly on the US East Coast are NAM, Norfolk, VA on 3356, 8080 (irregular) and 10865 KHz, and CFH, Halifax, NS on 4271, 6496.5 and 10536. CFH sends faxes on the hour, generally. I've found press fax on 9242, from Buenos Aires, Argentina.

** What modes are faxes usually sent in?

Weather faxes are usually sent with an IOC (Index of Correlation--the ratio of width to height) of 576, and an LPM (Lines Per Minute) of 120. Press faxes, the few I have found, use an IOC of 288 and an LPM of 60.

** OK, I'm hearing it. How do I tune in?

Using NAM, 10865 KHz as an example, follow these steps:

1) From the JVFAX main menu, hit F (Fax), and you'll be shown a blank screen with a tuning indicator and a menu box on the bottom of the screen.

2) Select the mode by hitting 1 ("Wefax 576").

3) Set the deviation to 400 by hitting the D key till it comes up.

4) Using your BFO, RIT or clarifier, tune the signal (in lower sideband) until you see a peak on the tuning indicator. Tune this peak towards the W (white) end of the scale (This will normally be 1.9 Khz below the center frequency, in this case 10863.1 Khz.) The indicator should look like this:

```
! <- Signal
! peak
! should
. . . .. .. .. . . ##! be here
----------------------------------------
B W
```

5) Hit A (APT); it should read "Running" and you should start to see a fax appear on the screen! To stop recieving, hit A again.

NOTE: If you have selectable filters on your receiver, set them to "wide" or "FAX" and set the RF gain as high as possible without overloading.

** I don't get a fax, or I get something garbled.

Check the mode; most fax transmissions use "Wefax 576", mode 1 in the program. The LPM should be 120. Check your connections to the interface. If that's in order, you may have an RFI or interrupt problem (see questions in "General Problems").

** I get a fax, but it comes out slanted.

Hit / and a line will appear; use the arrow keys to tilt and move the line so that it's lined up with a line on the fax (such as a border or a chart line). Hit Return, and the fax should now come in straight. Note that this is a permanent adjustment, and you shouldn't need to fix this ever again, no matter what faxes you subsequently receive.

** I get a fax, but it's not aligned with the edge of the screen.

Hit R (Rotate) and move a line with the arrow keys to the left edge of the fax (there'll be a black bar where the fax is supposed to start.) Hit Return and the fax should now be properly aligned.

** My fax is negative!

You're receiving the fax on the wrong sideband; try the other sideband. Most faxes are sent in LSB. A few press stations transmit negative pictures (JVFAX can be set to fix this; see the docs.)

** My fax is too dark.

** My fax is too light.

Your receiver is mistuned. If the fax is too dark, tune towards the white end of the tuning scale (peak moves towards W). If the fax is too light (washed out), tune towards the black end of the tuning scale (peak moves towards B).

Also, make sure the deviation is set correctly--at 400 for most faxes. This is especially important for receiving the GOES satellite images that NAM and other stations send.

** I started receiving a fax, but JVFAX stopped it (APT "waiting").

When reception is noisy or weak, JVFAX often interprets a noise burst to mean "end of picture". Hit A again to restart receiving. If this happens more than once, you probably won't get a very good fax anyway.

** How do I save a fax to disk?

While you're not receiving a fax (APT "waiting"), the S key will toggle the save-file option on and off. Faxes will be saved in .GIF format to the disk and subdirectory you specified in the configuration screen.

** I enabled Save to File, but when I hit A to start a fax, the Save feature turned off.

Go to the configuration screen (C from main menu) and check the save file specification. JVFAX won't save to a file if there's a typo (like "C:\\JVFAX") but it won't notify you of the error either.

** How do I print a fax?

Two ways:

1) While you're in the fax receive mode and not receiving a fax (APT "waiting"), P will enable your printer; it's a toggle, so hit P again to disable printing.

NOTE: You cannot have both Save to File and Print options enabled at once. Also, once the fax is printing, the Rotate command will not work on the printout.

2) Hit H (Show and Send Pictures). Select the fax you want to print. When it appears on the screen, hit P. JVFAX will ask how much width it will print in (0-100%); hit Return for the default (100%).

** The GIFs I save are too big! How do I shrink them?

It's not uncommon for weather faxes to be very large, especially if you regularly pick up 16-shade GOES images over NAM (a recent GOES fax from them "weighed in" at 870k!)

There are several methods you can use to shrink the size of your GIFs:

1) You can crop them. From the main menu select H (Show and Send Pictures); from the directory listing, select the file you want to crop. The fax will show up on the screen--select the Z (Zoom) option. Use the arrow keys to move the zoom box (which is about the size of a regular 640x480 VGA screen), and the X, Y, + and - keys to resize it. Hit Return and the cropped image will fill the screen. Hit S to save it (under a different name.)

2) You can reduce the resolution on faxes to be received. Most faxes (of the Wefax 576 variety) have a resolution of 1810x 1000, which makes for beautiful printouts, but is overkill if you're just using a GIF viewer.

To fix this, go into the Mode Editor (M from the main menu) and select the mode you normally use (e.g. Wefax 576). Step through the options with the arrow keys and select Resolution. For Wefax 576, it'll normally be 1810. Enter a smaller value (800 is OK) and hit Return.

If you're only interested in charts and not satellite images, select the Grays option and set the number of shades to 2 (B&W only--no gray scale). Your GIFs should be much smaller, though at a significant loss of resolution. (That being said, I once saved some GOES images from NAM for a friend of mine in 800x600x4 and they still looked good.)

** I get an all-white/all-black signal, no matter what signal is coming in on the receiver.

** I get horizontal white/black bands on my pictures.

** I get a white peak on the tuning indicator that doesn't move.

Either your audio cable to the interface is broken, or you have an interrupt conflict between serial ports. If it's the latter you may need to move the interface to another port.
(See "General Problems" for more on troubleshooting this.)

USING PKTMON

Unlike HamComm and JVFAX, Pktmon has few options and is simpler in scope. Using the same interface, Pktmon will decode HF and VHF packet. Pktmon can log to a file, and will optionally keep track of packets, assembling them into separate files for you. Note that the program is receive-only.

While it will never approach, let alone replace, Baycom or a TNC, I've been delighted with its very ingenious attempt at implementing AX.25 in software, and have found it a surprisingly fair performer. It even comes with source code (Turbo Pascal) for implementing your own projects with the interface!

There isn't much to running Pktmon, so here's a quick rundown through the prompts.

"COM 1 or 2?" Self-explanatory.
Pktmon doesn't support COM3 or COM4.

"Packet type?" Enter 1 for HF packet or 2 or 3 for VHF packet.
I've never noticed a difference between the latter
two options in use.

"Log bad packets?" If you answer Y, packets with CRC errors will
printed, otherwise, not. I usually choose to
log them.

"File to log all packets"

Self-explanatory. If you don't specify a file,
packets will go on the screen.

"File to log sorted packets"

Enter a filename, _no extension_. Pktmon will
sort packets to the files <n:filename.#>, #=
0 to 9. It also creates a file <n:filename.OTH>
for uncategorized packets such as beacons.

That's it. Pktmon will start decoding packets until you hit Return.
There's a tuning indicator on the top of the screen that indicates
activity. Here are some sample unsorted packets copied off the air
on 14099 Khz around 2300:

for KC4FS -0 => W1DXQ -0 traffic

Phone call Jack. Please wait...

****** connection inactive for 5 minutes

Now, the questions:

** Where do I find packet and what does it sound like?

On HF, packet can be found mainly at the lower end of 20 meters
(14090-14150 usually) and in the 30 meter band (10100-10150 Khz).
VHF packet can be found on 145.01, 145.03, 145.05, 145.07 and
145.09, among other places. It has a "braaaap..." sound quite
unlike RTTY.

** How do you tune in packets on HF?

On the upper edge of the screen, there's an "A" scale. While
hearing packets, tune VERY carefully until the scale reads 6 or
higher. Pktmon expects a tone frequency of about 1000 Hz.

** I'm logging sorted packets, but they're missing linefeeds.

You'll have to go into your favorite ASCII word processor and
have it insert linefeeds. I usually copy all the <n:filename.#>
files into a single file and fix it there.

** I'm getting lots of CRC errors.

On HF, this is, sadly, normal. Packet is just not well suited
to a ever-changing ionosphere, and it's marvelous that it works
at all. (When I copied the sample text, the ionosphere was
very quiet, an unusual occurence as I'm writing this.)

On VHF, on the other hand, CRC errors may be a result of Pktmon
being unable to keep up with transmission. 1200 baud is near
the limit for this type of interface. I've also found that with
my setup (in an apartment), I seem to be prone to multipath
and other VHF anomalies that disrupt reception, especially
of packet.

** The program locks up on me when receiving lots of packets!

If there's too much activity on the air, or the receiving tone
frequency is too high, Pktmon tends to lock up, as it can't
"follow" the signals fast enough. This has been reported by
several users on Fidonet.

According to the author, Pawel Jalocha, if Pktmon takes a long
time to terminate upon hitting Return, your machine may be

too slow.

GENERAL HARDWARE PROBLEMS

** Can I use EMM386/QEMM or other memory managers with HC, JVFAX or PKTMON?

Generally, no. HamComm, JVFAX and PKTMON are interrupt-intensive and use up most of the CPU cycles. That's the price you pay for having the demodulation and decoding done in software (rather than in a TNC). JVFAX comes with its own memory manager, anyway.

Note: While JVFAX 6.0 and HIMEM.SYS seem to work fine, if you have interrupt problems (blank pictures, streaks), try removing "DEVICE=HIMEM.SYS" and "DOS=HIGH" statements from your CONFIG.SYS before using JVFAX. I've not seen any problems with HIMEM and HamComm or Pktmon.

If you regularly use EMM drivers, Windows or Desqview, make up a minimal boot disk disabling all such programs, before running HamComm, JVFAX or PKTMON.

** I can't seem to receive freqs. higher than 100 Hz on the HamComm tuning screen.

The interface may not be receiving enough power from the serial port to operate. Modifications for a battery-powered interface are in the appendix.

** I get noise from my computer--HELP!

One of the most difficult problems in linking PC's with radios is RFI. It's beyond the scope of this FAQ list to cover every possible contingency, but here are some suggestions:

1) Keep your computer and your antenna *well* separated from each other and use good, well-shielded, coax for the lead-in.

2) The HamComm interface should be *shielded*--use a metal or foil-lined box. Use good shielded cable for both the audio and data connections.

3) Use RFI toroids (available at Radio Shack) on all cables.

4) Install 0.1 uF capacitors from the DTR and RTS lines to ground.

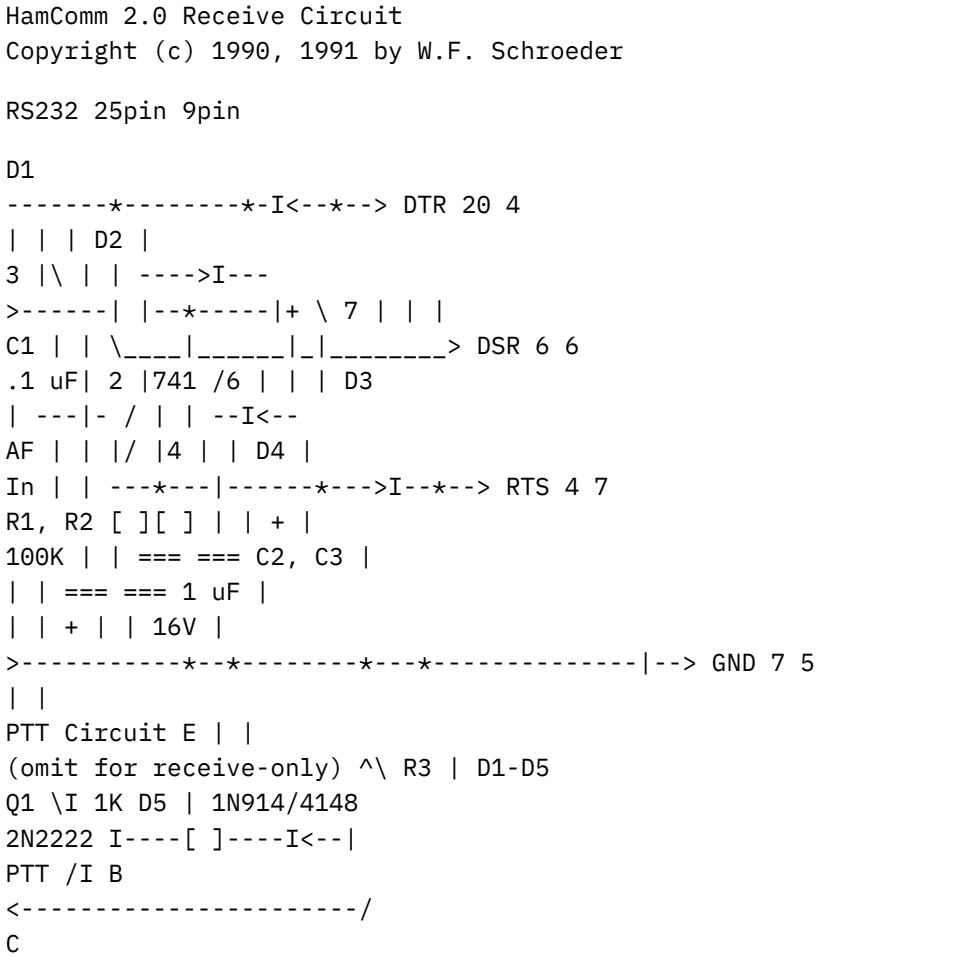
5) Install an audio isolation transformer between HamComm and the radio. (Radio Shack #273-1374).

6) Make sure the monitor, printer and their connecting cables are well shielded. Monitor noise is very common, as is printer noise.

In my case, I had to do all of those steps. My 286 PC was feeding RFI back through the earphone jack of my radio), *desensing* it (ouch!) I never got all the RFI out, but I reduced it considerably so that I only get a slight increase in background noise on a few frequencies.

APPENDIX -- THE HAMCOMM INTERFACE SCHEMATIC

Here's a schematic of the HamComm interface, reproduced with permission:



Battery Power Modification

```
+ ! + !
To Pin 7 of IC1 <--------!!---!!--------> To Pin 4 of IC1
! !
B1 (9V) B2 (9V)
```

Disconnect D1, D2, D3, D4, C2 and C3.

NOTE: HamComm sends RTTY through the COM port's TxD line, as well as the speaker. See the HamComm docs for more details.

If you're just interested in receive, omit the PTT and transmit audio circuitry.

None of the parts are critical, so raid your junkbox! Prices for equivalent Radio Shack parts are given for reference--which you can beat by judicious shopping/scrounging.

Parts List -- Main Circuit

Part	Value	Radio Shack #	Price (1994 catalog)
C1	0.1 uF	272-135	$0.69 (for 2)
C2, C3	1 uF 16 V	272-1434	$0.59 each
D1-D4	Diode, 1N914	276-1122	$1.19 (for 10)
*D5	Diode, 1N914	276-1122	
IC1	Op amp, 741	276-007	$0.79
R1, R2	100K	271-045	$0.39 (for 2)
*R3	1K	271-023	$0.39 (for 2)
*Q1	Trans. 2N2222	276-2009	$0.59

* Not needed for receive-only interface

Parts List -- Transmit Audio Filter

Part	Value	Radio Shack #
C1	.1 uF	272-135 $0.69 (for 2)
C2	.022uF	272-1066 $0.69 (for 2)
C3	.022uF	272-1066
R1	10 K var.	271-282 $0.49
R2, R3	15 K	271-036 $0.39 (for 2)

Miscellaneous:

Enclosure (RS #270-239 recommended, $2.19), PC board (RS #276-170, $2.79), audio jack (RS #274-316, $2.19 for 4), RFI toroids (RS #273-104 $7.95 for 2), DB-9 connector (RS #276-1536, $1.29), audio cable, plug to match radio.

If you buy all Radio Shack parts for the converter, it should cost $15 for the full circuit (plus transmit portion), not including the RFI toroids. Again, the circuit is not really critical--if you have any parts lying around that fit, use them!

SOME RTTY AND FAX FREQUENCIES

Here's a short list of RTTY and FAX frequencies heard around the world. It's nowhere near complete, but it'll get you started. These are mostly meteorological stations, with some press stations thrown in.

All FAX stations have a LPM and IOC of 120 and 576 unless otherwise noted. All frequencies are in KHz:

Station Frequencies Comments

USA 18102.5, 21095, 28095

There's now a database program of weather fax stations, WXFAX,
that contains information on 101 stations on 312 frequencies,
which may be sorted and printed in any order; it also includes
sample faxes. A demo copy can be found on nic.funet.fi, directory
pub/dx/software/msdos/misc, file WXFAX.LZH.

CLOSING COMMENTS

This FAQ list was the inspiration of myself and many others on the
Fidonet SHORTWAVE echo, who have been using and experimenting with
HamComm and JVFAX for over six months, trading ideas and hints along
the way. When more people asked me for help, there and on the
Internet, I thought of the obvious and wrote this! <g>

The following get credit for lending me a hand:

W.F. Schroeder (DL5YEC), Pawel Jalocha (SP9VRC), Reid Kelly,
John Palaima (N1NIG), William Nolle, Tom Carney (WB9RJX),
Ken McKenzie, Derek Buchler, Stephen Lee, Marius Rensen and many
others not cited here.

1890. PKFAX problems - any help?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-10 15:22:19 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <2ta0fbINNhtc@newsstand.cit.cornell.edu>
Source record: 48784

Hi,

A friend of mine has a new PK232 and the PKFAX program and is having some problems getting it to run. The 232 seems to work fine on all the other modes, it seems that this software is balky. I used to run it eons ago and recall it wasn't terribly handy at the time but I don't remember stones about it. Anyway does anybody have any good tips on getting this software to work properly? Hints, tips, or maybe a pointer to some third party software that does a better job on this?

Thanks in advance.

Kevin, WB2EMS

I would try changing the SwitchStream parameter in the TNC and in the
paKet configuration menu. Also, if your TNC supports ChangeDouble I
would us it. Sorry if I have the TNC parameter names incorrect, I'm
just trying to recall them from memory.

What program have you switched back to?

John, WB3ESS

1893. AMIGANOS 2.9n source?

1895. Another "What should I buy?" post

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-11 17:24:46 UTC
From: dem@skyline.dayton.oh.us
Message-ID: <2tcs0u$37g@skyline.dayton.oh.us>
Source record: 48789

With all the recent talk about getting TCP/IP on the air by making
an old 286 with NOS a router, I'm inspired to give it a shot. But I
know little about the cards referred to in recent posts that were said
to be much cheaper than full-blown TNCs.

Can anyone provide a recommendation for such a card? Hopefully one
that doesn't require an obscure NOS variant to operate. I assume
these cards are basically like TNCs, but only with KISS mode.

Any recommendations and enlightenment appreciated. Thanks.

From: kriss@austin.lockheed.com
Message-ID: <2tdtpj$p96@kestrel.austin.lockheed.com>
Source record: 48691

Help! I am having AFSK packet and RTTY output power problems with my Kenwood TS-450S/AT in digital modes. I have it interfaced with a PK-232MBX. The interface seems to be right, however, I cannot get anything other than a few (15 to 20) watts of SSB power. The MIC gain has little effect and I cannot overdrive the ALC. In the CW key-down, the rig puts out near 100 watts. It is just wimpy in the digital modes. Turning up the AFSK output on the PK-232 has little effect. Any suggestions will be appreciated.

The other side is that PCMCIA cards need device drivers that take up
memory.

from bnt@rhi.hi.is

Hello.
I was just hearing about the new Kantronics 9k6 packet
modem. I saw the advertisment in QST, but no price or
info. I don't want to wait some months to see some
reviews in the amateur magazines plus, the prices from
e.g. A.E.S or some other major amateur equipment supplyers.
So please if you know something about this modem, especially
price, please e-mail or reply to this article.
I think I can trust Kantronics, as I have the KAM and the
MFJ-1278 (whith the MFJ-9600 modem), but I would like to
free the MFJ from the packet only operation on my BBS.

So tnx in andvance

You assume incorrectly. There is a card on the market that *is* a TNC, sort of analogous to an internal phone modem instead of an external modem, but that offers no advantage over an external TNC. The reason we want to use the internal cards we've been talking about is to *eliminate the troublesome TNC* completely from the packet system. Most of us no longer use *terminals* that need controlling. Instead we use full fledged computers that are capable of handling the complete protocol stack internally while avoiding the interrupt per character bottleneck that limits performance with TNC->Comm port setups. The cards we've been discussing, Gracillis PacketTwin and Ottawa PI, bypass the bottleneck by doing direct DMA to computer memory and generating a service interrupt per *frame* instead of per character. This makes speeds of 56kb+ practical on a PC. The secret is the 8530 HDLC chip and DMA controller chip on the card, both programmable by the PC. There is no microprocessor on these cards at all. All of the low level processing is done by ISRs in the PC. Both of these cards are directly supported by NOS.

The Ottawa PI card has only half duplex DMA, but that's sufficient for most purposes. The Ottawa group has a new card out, the PI-2, but I don't have any first hand experience with it yet. The PacketTwin offers duplex DMA, but costs about 2.5 times as much. (This is what I'm currently using.)

Gracillis also offers a "super" card, the PacketTen, that can be had in standalone or PC plugin form. This is a *router on a card* that runs a special version of NOS out of it's internal ROM. It can support up to 3 T1 channels and 2 lower speed channels at once using a special Motorola communications processor chip. (These cards aren't cheap, around $750.)

There is also a cruder card on the market, the DRSI PCPA. This card has an 8530, but no DMA support. You're stuck doing interrupt per character with this card, which limits it's performance. It's still better than using a traditional TNC.

For low speed packet, there's the little Baycom adapter and driver. There's really no reason to use a TNC, KISS or otherwise, anymore.

That's an obsolete technology that only acts as a bottleneck to
superior performance.

Note: Everything talked about above, aside from the Baycom unit which
basically *is* just a modem, require separate modems to operate. These
cards are just the digital interface to the high speed modems. These
high speed modems are *dumb* modems with no processing at all, aside
from perhaps some DSP applied to the signals, the entire protocol stack
remains in the PC where it belongs.

Since both the Ottawa guys and the Gracillis guys read this group, perhaps
they can post, or send you mail, about their latest offerings.

The Kantronics 9600 baud modem is a G3RUH copy, like the MFJ
and the PacComm. The only difference is in form factor of the
card to fit the different TNCs. Street price is in the range
of $87-$109 at most shows. Aside from kludging the packaging,
your MFJ 9600 baud modem will work in the KAM.

Gary

This would be prohibitively expensive. Most TNC designs are based around
a Z80 family member. The Z80 (last time I checked) is not available in a
1 or 2 millimeter package, along with the peripherial components a Z80 design
uses (Z80-SIO, CTC). Memory would not be a problem, and a number of people
(including Zilog), make the PCMCIA interface chip (Zilog is proud of thiers,
because it's supposed to be very inexpensive). PCMCIA cards still base out
around $200. Packaging is not cheap (plastics cost money), plus someone
would have to write a socket driver for the card on the PC side (even when
you use NOS, you can't just "go use" a PCMCIA device). Look at what Paccomm
still gets there for thier super small TNC, well over $200. Of course, it
does include a battery, but even so, it takes up a lot of space. I'm willing
to bet that right now, it would take a minimum of a type III PCMCIA card size
to do this project.

But it would be cool, wouldn't it?

: After days of a few of us new owners struggling to get our C50 DSK's
: going, we decided to call TI. The tools worked OK, the Loader alone
: did not.

: It seems that that EXE was compiled under OS/2 and will not run under
: "plain" ms-dos.

: Jason Chyan advises that a new EXE will be on the TI BBS in a "few weeks".

: Oh well.....

Thanks Jim,

At least the assembler and debugger work on DOS :-)

I noticed that the op codes produced by the 'C26 assembler are different
than those produced by the 'C50 assembler. For example, a 'call'
instruction assembled by the 'C26 assembler is 0feh but is 07ah when
assembled by the 'C50 assembler. This is true with other op codes
as well.

Therefore, 'C26 programs will not run on the 'C50 DSK.

There is a table in the 'C50 User's guide (page 4-257) that gives
the instruction set mapping from 'C26 to 'C50.

To convert a 'C26 program over to the 'C50 will require translating
many of the assembly instructions from 'C26 to 'C50 and then assembling
using the 'C50 assembler. In addition, the 'C50 has a different
memory mapping scheme, but that is no big deal.

Hopfully some of the authors of the existing 'C26 programs will be
able to find time to do the conversion.

Its interesting to note that the new generation of PCI interface cards that conform to the (proposed) open system interconnect standards all run a threaded interpretive language (i.e. FORTH)! This interpreter is very compact and can be implemented well of virtually any processor... and is a nice machine independant solution to boot time configuration before the system knows what kinds of cpu/card has been connected.

I think we are going to see a resurgance of TILs such as FORTH for distributed and machine independant systems... sounds like this was a good suggestion.

: kd5vu@austin.lockheed.com

Couple of thoughts. Firstly, I recommend you run the 450 in FSK mode,
rather than AFSK mode. You will find that the filters work wildly better,
because the radio automatically adjusts the bandpass. No comparison
between AFSK and FSK for this radio, for Amtor and Pactor modes.

If you insist on running AFSK, then remember that all the TNC is is a
source of modulation for the TNC in LSB mode. Most TNCs, such as my
PK-232, have an adjustment on the back which adjusts the modulation
mode. Look under "calibration" in the manual.

The 450 is a great digital radio. You should have no trouble. But once
again, I recommend that you wire it up for FSK rather than AFSK.

73 and hope to cu on the digital bands soon.

1907. Help: How to become a Internet gateway?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-12 22:30:54 UTC
From: bnt@rhi.hi.is
Message-ID: <2tg2au$959@eldborg.rhi.hi.is>
Source record: 48704

Hello all.
I am one of few (15-20) packet enthusiasts here in Iceland.
I run one of 3 BBS'es, in the southern part of Iceland, where
98% of all amateurs in TF land are located!
We have had 3 BBS'es witch have they're own task. One serving
as a main BBS with HF forward: TF3BBS witch TF3EJ operates.
TF3LJ witch is our SatGate. And my BBS witch serves as a local
CD-ROM server with lots of shareware programs and other common
interest, as NetNews bulletins.
Sadly (but understanding) TF3EJ witch operates TF3BBS is
trying to get rid of the enormous task of running a HF BBS
and is trying to pass it to someone else, whereas he is also
going to take a summer vacation for a month or longer to Japan.

So what we need is for someone in Iceland to take over the HF BBS!
But unfortunately no one is quite capable to run the HF BBS, for few
reasons : 1. All the really active packet guys are all technical class
2. The HF men don't have enough time or equipment and computer knowledge.

So we have been thinking of putting up a Internet gateway, but
How!?. I have the access to a HP-UX computer (HP-9000) via
telephone line, good knowledge about Internet and I'm
a programmer (Pascal,TC and assembler), but not HF-license :-(
(Active though on AO-13,21,27). We all run the F6FBB packet BBS program.

So all I need to know is:
What Unix and Dos software do I have to get,
Some info on interfacing to the F6FBB BBS program.
Some good advice,
A forwarding partner(s)!!
Is there a FAQ or some text file on Internet forwarding, other
than just the rules.

Remember TF3LJ is a good durable SatGate, We have the packsats
very often for our selves!

So PLEASE HELP!

Actually, I don't think the KAM can do 9600 at all. I asked the Kantronics rep
about the KAM and 9600 and was told that the KAM does its HDLC processing in
software rather than the hardware implementation that the TAPR II and clones
use. The software is fine for 1200 baud and slower, but just can't handle
9600. The Kantronics data engine does work very well at 9600 and a G3RUH
clone ought to work well in an TNC II clone.

Oh...I understand that the KPC-3 also does HDLC in software, so it will never
do 9600 either.

Tell us some more about your setup. Are you connected to the AFSK input jack on the back of the TS-450? Are you measuring the output with a separate watt meter while hooked to a dummy load?

The way to figure out the problem is to eliminate as many variables as you can, hence the suggestion to use a dummy load. The TS-450 has an FSK input mode, I believe, which you might also try.

Actually, it should be possible to make the PCMCIA card appear to the system as a serial port, much as a modem card plugged into a PC does. Not that this is necessarily an efficient approach, but it does cut down on the drivers and special software...

From: Greg Law <gregl@delphi.com>
Message-ID: <xq+sPlQ.gregl@delphi.com>
Source record: 48705

I have tried to compile JNOS with Borland C++ 4.0 and found that it just would not work. Apparently Borland C++ 4.0 (and the run-time library) does not like it when we fiddle with the stack frames. At least that's a big problem I ran into. I couldn't even use Turbo Debugger -- it crashed -- to find out exactly why and were it was bombing. I was able to run JNOS when compiled with Borland C++ 4.0, although I did not attempt to attach any ports, but it crashed the system when I tried to exit to DOS.

The only solution I've found so far is to compile it with Borland C++ 3.1. I realize this is not the ultimate solution, but is one I could afford by installing a minimum version of Borand C++ 3.1 in a separate directory. I just received a certificate to upgrade to Borland C++ 4.1 and to get the DOS extender at a "reduced price." I plan to get the DOS extender and attempt to get JNOS to run with either the 16- or 32-bit DOS extender. Memory is real tight (excruciatingly tight!) with 64K segments.

I disagree, Erich. I think it's as much a part of radio as contesting,
dxing, experimenting - all those different modes. Frankly, it seems to me
that traffic handling and bbs's are the thing for which packet is most
suited. Voice communications seem to me to be far more efficient for real
time. This based on holding a ticket for 40 years now and getting into just
about everything I could. :)

Hmm. Good point Glenn. I used real TNC2 type TNCs when I was using
TNCs. I had forgotten that the Kantronics boxes are gutless wonders.
Still, I do know that the Kantronics 9600 baud modem that fits the
Data Engine (and the Gracillis PacketTwin) is a G3RUH clone, and will
work with MFJ and PacComm TNCs, though it's physically the wrong shape
to fit in the cases.

: Internet : packman@cix.compulink.co.uk

I was recently surprised to see references to ka9q code in a package
of Ftp Software's PC/TCP for dos. This package comes with some
winsock stuff (I think...), and although the source isn't available, one
might coax an ax25 packet driver into working with it. I suspect that
this is typical of many dos networking packages.

As far as other computing environments, work done for Sunos, and recently
Linux, points in this direction-- these provide kernel-layer interfaces
to the ax.25 world. The chalenge now exists to write software to
bridge between where packet users are today (mostly store/forward bbs
style systems) to something a bit more transparent.

I agree with Larry, realtime "chat" mode is about the worst use for
packet. We have other modes that are much better suited to this type
of use. Packet is useful for the things it can do better than other
modes, and store and forward is a primary example of where packet
is superior to other modes. Packet does that well, but it isn't a
substitute for a microphone when the need is for realtime person to
person communications. Hopefully, as the network speed increases,
realtime machine to machine communications will become an important
application facilitator, but right now non-realtime store and forward
is the niche best served by packet.

Gary

>clone ought to work well in an TNC II clone.
>
>Oh...I understand that the KPC-3 also does HDLC in software, so it will never
>do 9600 either.

Kantronics has just announced a new box that handles one port for 9600 packet
and another for 1200 packet. The HDLC framing is in software. Keep in mind that
there is absolutely nothing wrong with using a software solution. It allows
a MUCH simpler method for providing fixes should a problem be found. Suppose
you find a bug in an HDLC-capable SCC chip? The usual answer to that is to
live with it...

I'm looking forward to trying one of the new Kantronics 9600 boxes...

Wow! I'd love to be able to set my TXDelay at 18 (180ms). I currently have to
set it to 40 with my GE Custom MVP. Anyone got any ideas how I can speed my
MVP up? How about mods for 9600 buad?

Message-ID: <9406131701.AA12603@GRSEQ1.gr.oracle.com>
Source record: 48707

Hello folks,

I would like to share with you some problems I faced the last few days, while I was trying to setup a NOS front-end PC at home.

I spend the last few days, setting up a dedicated NOS front-end to collect my mail. The front-end was to stay on, all day long, so I wanted to use dedicated equipment, in order to avoid problems at my normal rig, PC, power supply and TNC.

I got a 386SX with 1 MB RAM, I already had a 10A power supply and an IC-229 VHF rig. All I needed was a TNC, so I opted for Baycom.

I installed the small modem and made the connecting cables. However, my modulat ion was uncomprehensible, and I could not demodulate other stations.

After making sure that everything was connected correctly etc, the cullprit was found to be a TSR (terminate-and-stay-resident) clock program, that I was using, to show the date and time, on the top right corner of the screen. It looks as if this program, is creating a havoc since it is stealing interupts from the system (since it is monitoring the DOS clock, thru interupts) and screwed up the Baycom transmitting and receiving capabilities.

As soon as I removed the clock from memory, Baycom works fine!

Another problem I faced was that, while I could do ftp at other stations, when I issued the 'dir' command, I was getting the message 'cannot read directory' (or something similar). Strangely, althought I could not see the directory contents, I could ftp a file I knew it was there. Well, it turned out that althought my environment was set up for 'SET TMP=C:\TEMP' and 'SET TEMP=C:\TEMP', a \temp directory did not exist. As soon as it was created, everything returned to normal.

My 2 cents contribution.

Change your TNC setting to (Filter On). With Filter set to On, your TNC
will inhibit control characters (hex$00-$19) that may be present in monitored
packets: ie. binary or compressed data file transfers.
My TNC manual says that embedded control characters can have
< STANGE AND UNPREDICTABLE RESULTS > on monitored packets, such as stream
switching. All control characters except carriage return and line feed will
be filtered out. This command is not active when you are connected to
another station. My setup is a KPC3/Paket 5.1.

Not a bad idea. In the System V world, an AX.25 Streams module would be
cool, though a really good one would allow both AX.25 sessions and
other networking sessions, and would be a multiplexor module, not as
easy as a straight AX.25/IP module. NDIS should be pretty straightforward,
though I have to write an NDIS driver.

>Can you imagine running PC Mosiac for an Amateur Radio WWW?

No. Well, on second thought, I can. It would suck. Here's a :-) for those

1927. Packet Ideas Sought...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-14 02:15:46 UTC
From: Kenneth.E.Harker@Dartmouth.Edu
Message-ID: <2tj3si$96v@dartvax.dartmouth.edu>
Source record: 48720

I'm thinking this summer about what I might want to do for a
senior thesis in computer science next year, and I've decided that if
it is possible, I would like to do something involving packet radio.
Im still trying to think of something to do, however. I have a few
thoughts:
The focus of whatever I do is probably going to revolve around the
nature of the amateur network as a fairly slow one (1200-9600 baud with
rare exception.) It is also currently almost entirely accessed through
text based terminal programs. There are a few specialty products on
the market, but these are all most entirely specialty terminal
programs. So, I could possibly explore something about the nature of
the interface used to access the services in the network. I could
possibly explore the use of something like an X Window system or
similar open protocol for graphically-oriented distributed,
client-server programs.
Or I could possibly explore the netwrk for another angle, and ask
the question "what services should be provided and how can they be best
provided?" "What sort of changes/enhancements in the network will be
the most beneficial to the user community?" Is there something like
hypertext that will greatly improve the nature of the network?
If you have any thoughts on this, I would appreciate it if you
would drop me a line, or start up a general discussion of it here. I'm
just sort of collecting thoughts at this stage, so anything might help.
Also, if anyone knows of a good source for technical documentation
on AX.25 or TCP/IP or the packet network in general, I would appreciate
the pointers.
Thanks and 73's...

Maybe not on 1200 or 9600 bps packet, but it's gangbusters at 56 kbps!

Don't limit your sights to the Least Common Denominator. There's nothing stopping us from implementing packet at Ethernet rates (or faster) on the higher bands. 56 kbps is here now (on 220 Mhz and up) and Mosaic *is* usable at that speed.

Of course it's usable at 56K. Our whole university uses it with only one
56K line feeding the entire Campus Network.

Now, when do you anticipate the majority of hams having that kind of capability??

Or even a measurable percentage of hams??

Not in my lifetime, I'll wager.

Gangbusters? Speaking from experience, I'd characterize it more as barely
useable... It doesn't win me too many friends on our shared 56K lan either.
Oh well, it gives us a goal to shoot for...

Hi All:
I have a dead Emerson 1415EM VGA monitor. I tried to get Emerson cutomer service but got disconnected every time. I never talked to a real person. If anyone has a service manual for this monitor I would very much like to get a copy of it. Even a circuit schematic would help. The technician who takes care of The Engineering Tech. departments equipment is trying to fix it but it is difficult with no information. Any help would be greatly appreciated.
Thanks.

1938. Lan-Link 2.30 is released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-14 21:07:49 UTC
From: ken@shore.net
Message-ID: <ken.44.0015219F@shore.net>
Source record: 48734

I just got a notice from Joe Kasser G3ZCZ that he has released version 2.30 of his packet interface LAN-LINK.

It's available for download from his BBS I guess, but does anyone know if its on an FTP site anywhere?

Ken Smith ken@shore.net

Jeremy, KB1AWE, a young and very enthusiastic ham from our local club will be visiting a relative in Birkenau from mid July to mid August. Jeremy is very active in digital modes and is thinking about taking some of his equipment along. He would like to get in touch with any hams in DL-land to see what the possibilities might be.

I'll be glad to play courier for messages to Jeremy, and/or to facilitate initial direct contact. (Jeremy's only HF privileges currently are on 10M).

Thanks es 73

Drivers take up memory if you use DOS. Friends do not let friends use DOS. Some of use use operating systems, instead of program loaders, like DOS.

1943. aprs503a.zip - Hams: Automatic Packet Reporting System (APRS)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-15 06:40:18 UTC
From: TPDugan@dockmaster.ncsc.mil
Message-ID: <9406150640.AA7515@SimTel.Coast.NET>
Source record: 48736
Cross-posted to: rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/packet/
aprs503a.zip Hams: Automatic Packet Reporting System (APRS)

APRS provides real-time display of operational traffic via UI frame broadcasts and map displays. A station with information to contribute transmits, and all stations on frequency receive and display it.

APRS503A adds some more map symbols, and contains a number of other improvements and bug fixes.

aprs503a.zip is the latest version (as of 10 June 94) of APRS, and contains all files. It has replaced aprs501a.zip.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

There's a big difference between a 56kb/s full-duplex landline
connection and 56kb/s amateur half-duplex packet.

I for one think it would be the cat's meow to build a fast, wide area
network on radio. I mean, people like MCI, ATT, and others have shown
us how.

Jeff,
Try calling R&D Micro Inc, in Mission Viejo, CA. (714)830-1387.
They manufacture and sell empty PCMCIA type 2 card frames, complete with a nifty 15-position connector and cable assembly out the end of the card. If you do design such a device, would you mind sharing with those of us who might want to build them ourselves? I have the necessary hardware/software experience to build one, but very little time to devote to the project...

1954. PACTOR FEC Frame

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-15 21:14:03 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9406152013.AA11007@ATK.COM>
Source record: 48645

Subject: Time:3:08 PM
OFFICE MEMO PACTOR FEC Frame Date:6/15/94
Last week I was in D.C. teaching the course on low cost digital and packet radio theory and applications for the U.S. Telecommunications Training Institute. It occurred to me in the course of teaching the TOR's, that I didn't have a description of the PacTOR FEC frame in my literature collection. Study of PacComm's PacTOR Controller manual didn't reveal the answer. A call to PacComm didn't yield the answer. The PacComm technical representative recommended I contact Dr. Tom Rink at SCS in Hanau, Germany, directly. So I did. The following is the fax reply I received from Tom.

"A PACTOR FEC transmission is nothing but normal PACTOR data packets in a row. The only difference to the normal ARQ scheme is the omitted receiving gap, thus the [FEC] packets also consist of header, data field, status, and CRC. All information is used in the same way as in an ARQ link, i.e., the header is required for synchronization, the data field contains the user information, the status defines the packet number as well as the used code and the CRC contains the checksum."

"As you probably know, the number of repetitions of one packet as well as the baud rate (100 or 200 baud) can be adjusted by the user. This allows to choose for example only two repetitions and 200 baud absolute speed in good propagation conditions and say 5 repetitions as well as only 100 baud in bad conditions."

There you have it, TOR fans! The PacTOR FEC frame revealed (assuming, of course, that you've done your homework and know how the ARQ frame is constructed). Remember, you read it first right here on the "ham digital" newsgroup.

By the way, I note that Tom used all upper case PACTOR so I'll change my ways and quit calling it PacTOR.

I have heard a legend that a college radio station (either at MIT, Tufts, or Swarthmore) welded antenna to railroad tracks, and peeved the FCC by broadcasting nationwide. Is this true? If anyone knows, please email me (or post here) If you do know, could you please direct me to some documentation regarding this legend if you can.

This is very important! Thanks in advance.

1960. KAM Plus Cockpit Troubles (newbie wannabe)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-16 07:13:57 UTC
From: ceddlemon@tecvax.stim.tec.tn.us
Message-ID: <1994Jun16.011357.278@tecvax.stim.tec.tn.us>
Source record: 48651

I purchased a Kam Plus last Fall, hooked it up to play with it for a
few days and had to set aside for several months during a period of a
serious family illness.

Last Dec. and Jan. I had lots of fun seeing the packet messages from the
unit using my Icom HT and '386 computer. Last week I hooked it up again
and can't seem to get it to put any messages up on the screen.

I've tried using it with a BC-142XL scanner so that I could easily confirm
packet activity on 145.01, 145.03, etc. The RcV light comes on as before
but I'm wondering if I got over in the TERM mode of this unit where there
are a ton of features (PAKTOR, CW, etc) and could have engaged something
that is not allowing the paket signals to be processed?

Should I try to reset the unit back to the NEWUSER state and start over?
I'm sure I could find a local who could try it out for me.

The computer hookup seems OK. ie I can give it commands and the unit responds.

The disk from Kamtronics came blank ... believe me it was unformatted!
Someone told me to give the Paket 5.1 program a try before and that's what
I'm using right now. Someone else told me just to use a simple terminal
emulator program ... and I could do everything I needed to do.

The KAM manuals are readable but mean little to me as a newbie packet wannabe.
I understand what being said but there's little there for a newuser.

Any suggestions on where I might start to see if this unit is only suffering
from my setting one of those zillion other parameters outside the NEWUSER mode?

Charles EMail replies to ceddlemon@stim.tec.tn.us

PS I've told the KAM to use COM2 at 1200 baud since mouse is on COM1. The
commands from the keyboard seems to get into the unit OK.

1961. Connecting Alinco HT to TNC

A Proposal for a Standard Digital Radio Interface

Jeffrey Austen, k9ja
2051 Clearview Dr., Cookeville TN 38501, USA
Internet: jra1854@tntech.edu
PacketBBS: k9ja@wa4uce.#midtn.tn.usa.noam

Introduction

Just about everyone who has ever used packet radio has had to deal with what should be a simple task: that of properly connecting radios and terminal node controllers (TNCs) together. Unfortunately, many people have learned that it is not very simple. Not only do the proper signal connections need to be determined between each radio and TNC but the correct audio levels must be set in order for the system to work well. This problem is compounded for persons with multiple TNCs or multiple radios. Every time a radio or TNC is changed, the system must be readjusted for proper receive and transmit audio levels, as well as proper delay times to accommodate the key-up time of the transmitter. These problems are exacerbated by the existence of differing connectors for different models of radios and TNCs. All of this can be attributed to the fact that the interface between the equipment uses analog signals despite the fact that packet radio is a mode of digital communications. For operation at speeds greater than 1200 bits per second (b/s) most radios do not even provide a connector for the appropriate signals. Operators of digipeaters or remote sites are burdened with the task of hauling around extra test equipment and adjusting radios on-site instead of performing these adjustments in a convenient location such as a laboratory or home station. Emergency operation is difficult because it is almost impossible to properly connect various equipment quickly in the field unless the exact configuration is known beforehand.

In this article a proposal for a digital radio (DR) interface is developed. This interface is designed to support all current packet modulation methods and speeds and any which can be reasonably anticipated for future use. It provides "plug and play" operation between any digital radio and TNC (from here onward the term TNC refers to a TNC or any other device, such as computer or packet switch, which processes the data being communicated). It can be easily incorporated into most of the current equipment and it allows the use of a single radio in multiple packet modes without changing cables or making any adjustments.

Requirements

The requirements of the interface are as follows:
- connect any DR to any TNC;
- be transparent to the data stream;
- operate over a wide range of speeds;
- operate with both synchronous and asynchronous modulation modes;
- operate in both full- and half-duplex modes as well as in transmit-only and receive-only systems;
- provide good immunity to electromagnetic interference (EMI);
- be tolerant of variations in the equipment: not require any adjustments when equipment is changed;
- operate over cable distances from zero to at least 10 meters;
- be usable for all existing digital communications modes and for all anticipated modes in the future;
- operate at all existing speeds and at all reasonable future speeds, at least up to 2 Mb/s;
- have a single standardized connector so that connection is "plug and play;"
- sense when cable is disconnected or when the DR is powered down;
- make use of existing standards, where possible; and
- allow easy migration from the current system.

Development of the Interface

In a digital communications system the digital information is communicated by representing the information as an analog signal. For the interface the simplest representation should be used for the information being sent: this is a serial bit stream. To do this, it is necessary to move the "modem" out of the TNC and into the DR. This change has a benefit of making the dual use (voice and data) of the radio easier to accomplish. A front panel switch could easily select between voice and one or more data modes; for example, a 2-m radio might be built to support voice, 1200 b/s packet and 9600 b/s packet.

Many standards have been developed for use in data communications. Some standards which are related to the needs of this interface are EIA/TIA-232, EIA/TIA-422, EIA/TIA-423, CCITT V.10, V.11, EIA/TIA-449. There appears to be no standard which provides the necessary functionality; however, some standards can be incorporated into the interface.

Examination of the information which must be communicated across the interface yields the required signals. The fundamental information which must be conveyed across this interface is receive data and transmit data. Auxiliary information is necessary to indicate where each data bit is, when the data is valid, and when the data can be sent and received. To accommodate both synchronous and asynchronous systems at varying speeds a synchronous interface is used. The receive and transmit clock signals originate at the digital radio and are independent of each other.

To send data from the DR to the TNC the following items are necessary.
- Receive Data: the data from the DR to the TNC.
- Receive Clock: a clocking signal for the receive data, originating at the DR.
- Receive Data Valid: a signal originating at the DR which indicates that the receive data signal is valid (similar to carrier detect).

To send data from the TNC to the DR the following items are necessary.
- Transmit Data: the data from the TNC to the DR.
- Transmit Clock: a clocking signal for the transmit data, originating at the DR.
- Request To Send: a signal from the TNC to the DR indicating that data transmission is requested.
- Clear To Send: a signal from the DR to the TNC indicating that data transmission may proceed.

One other signal is necessary to convey the DR status to the TNC.
- DR Ready: a signal from the DR to the TNC indicating that it is powered up and capable of reception and/or transmission of data.

The Interface Proposal

The signals listed above will be sent using a combination of EIA/TIA-422 (differential) and EIA/TIA-423 (single-ended) signal levels. The two data signals and two clock signals, because of the potentially high speed will use differential signaling, which provides for speeds of up to 10 Mb/s. These signals will use eight wires of the interface. The status signals will use single-ended signaling because high speed is not necessary. These signals will use four signal lines and two ground lines (one in each direction, per EIA/TIA-423 specifications). To insure proper operation under fault conditions (either unit is powered down or the cable is not connected)"fail safe" line receivers must be used for the four status signals (RDV, RTS, CTS, and DRR).

Much of the delay necessary at the beginning of the transmission are due to internal delays in the transmitter. This delay is made the responsibility of the DR rather than the TNC. When CTS becomes active, data can be sent immediately; after the last bit of data has been sent, RTS may become inactive. Additional delay may be added in the TNC (as is done currently).

The physical connector selected is a high-density 15-pin D-series connector. This connector is small enough to be used on mobile and portable equipment and yet it reasonably rugged, reliable and inexpensive. The male connector (plug) is used on the TNC and the female connector (socket) is used on the DR. Although the same type of connector is popular for computer displays, the opposite sex connector is used on the computer so that confusion should not occur. Cables will act as "extension cords," that is they pass all pins straight through from the connector on one end to the other end. The shell of the connector must be used for the shield connection if a shield exists on the cable; if no shield exists the shells must be connected by a wire in the cable. All DRs and TNCs must have metallic connector

shells so that shielded cables can be used effectively.

Alternative Interconnections

Although the interface is specifically designed to connect a DR to a TNC, it can be used to connect two DRs or two TNCs together or it can be used in a transmit-only or receive-only system. To connect two DRs together there needs to be a adapter which contains a FIFO large enough to accommodate the largest packet at the maximum speed differential between the systems. To connect two TNCs together there needs to be an adapter which generates appropriate clock signals. The receive and transmit signals are independent of each other so they can be running at different speed or be going to different DRs; use in a transmit- or receive-only system is also possible (a protocol other than AX.25 will be necessary in this case).

Incorporation Into New and Existing Equipment

This interface can be incorporated into new radio designs by including the "modem" with the radio and providing a method for switching modes (e.g., voice, 1200 b/s data, 9600 b/s data). Most TNC designs can be updated quite easily to incorporate the interface without eliminating any current features.

Most existing systems can be easily modified to use the new standard. It appears that the PackeTen, DataEngine, PI, PI2 and PackeTwin cards and Kantronics DataEngine modems require very little modification as the appropriate signals are available to easily add the interface; the only significant change is that with the new interface the modem is physically housed with the DR, not the TNC. In general, any modem which performs clock recovery can be easily modified for use with this interface. Any TNC which provides the "modem disconnect header" can have the interface added to it by using that connector. A smooth transition from the current system to using the new interface can be made by providing adapter kits for common modems and TNCs so that current equipment will not be obsoleted.

Summary

The interface proposal presented here will solve the problem of connecting digital radios and terminal node controller or computer equipment together. It provides a simple, inexpensive, versatile, and easy-to-use solution. It is applicable to all current packet radio systems, as well a other digital systems and it does not inhibit future improvements to packet radio systems, either in the modulation and coding techniques or in the protocols. While the exact specifications remain to be finished and tested through implementation, much existing technology is being used and no problems are anticipated. The author welcomes suggestions for the improvement of this interface and is interested in hearing from a few persons who are willing to design and test interfaces for various modems and TNCs.

1964. Re: Mac or IBM? open letter from amateur digital music producer

Newsgroup: rec.radio.amateur.digital.misc

> appreciated.

In a word, my opinion, Macintosh. There is no other hardware or software or
combination that is as trouble free as the Mac. Some mistakenly list the
Mac's primary attribute as "user friendly", which is interpreted as "hand
holding". When the ultimate in user friendly-ness is "trouble free".

Used Mac Plus's are running $300 or so with 4M RAM. New Performa 605's are
about $700 with 4M/80 and color monitor (check Wal-Mart). HP DeskWriter
printers are currently advertised new for $199 in MacUser. New Pentium-Eater
PowerMacintosh 6100/60's are $1650 in 8/80 form (or is it 8/230?) just add
one or two monitors and your choice in keyboards.

Seems unlikely. The railroad system is not one giant circuit. There are
breaks everywhere.

[stuff deleted]

In all of the rambling I lost track of how many of the 15 pins would be used and how many would be spares. Some ASCII art would be helpful here. Anyway, make sure there are plenty of spares even if you need to go to the 25-pin D series. Straight through DB 25 modem cables are plentiful and cheap. While the author said future growth was being taken care of, I did not see mentioned some of the future features that have been discussed here, such as automatic adaptive control (power, bandwidth, frequency, cellular like), which will require more parallel circuits between the TNC and DR.

I have a midland 70-245b uhf handheld radio. it is 16 channel and reprogammable. I would like to be able to do this on my own without having to take it into a mobile radio shop everytime I would like to change something. Does anyone know how I might do this (I am aware that you need an adapter and some software to do this)? Has anyone kludged up a way to do this without paying the big bucks midland wants for their adapters and software?

Thanks in advance, graham.collins@tabb.com

Plus wouldn't it be grounded at points? I don't know if insulating
the tracks is a design criterion. This would make it even more unlikely.

1970. FCC Action On Automatic Con

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-16 16:55:20 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9406161551.AA22761@ATK.COM>
Source record: 48662

Subject: Time:10:28 AM
OFFICE MEMO FCC Action On Automatic Control Date:6/16/94
Below is an abbreviated copy of the FCC's long awaited announcement on authorization of unattended automatic (and semiautomatic) control of HF digital stations:

Report No. DC-2613 ACTION IN DOCKET CASE June 15, 1994

AUTHORIZATION OF AUTOMATIC CONTROL FOR HF DIGITAL COMMUNICATIONS IN AMATEUR SERVICE PROPOSED
(PR DOCKET 94-59)

The Commission has proposed amending the amateur service rules to authorize automatic control of stations transmitting a digital emission on the High Frequency (HF) amateur service bands.

[4 paragraphs omitted]

The Commission said it was gratified by the cooperation and dedication of organizations within the amateur service community in determining the conditions necessary to allow automatic control of stations transmitting data and RTTY (narrow-band direct printing) emission types on the HF amateur service bands. It agreed with the petitioners that automatic control of amateur stations in the HF bands can, with safeguards, make the transmission of data and RTTY emission types practical and effective.

Therefore, the Commission proposed to authorize automatic control for stations transmitting data and RTTY emission types on one specific subband of each HF band where such emissions are authorized. It also proposed to authorize communications between a locally or remotely controlled station and an automatically controlled station on any frequency where data and RTTY emission types are otherwise authorized.

[2 paragraphs omitted]

It looks like the FCC "bought" the idea of subbands for unattended automatically controlled stations. It will be interesting to see if they are the same subbands requested by ARRL based on IARU recommendations (which, in my opinion, provides way too much spectrum for the "robot" stations on 20 M). It will also be intresting to see if the FCC "bought" the idea of limiting unattended semiautomatic stations to 500 Hz bandwidth and, if so, how they

define "bandwidth." For example, by one definition (CCIR) the 300 baud 200 Hz shift G-TOR signal would occupy 540 Hz.

Modern railays use "block control/detection" for location of trains. This system relies on the the fact that a railroad train can be a moving short circuit. This fact is detected for block detection and to signal level crossings of the presence of trains. To do this the rail system is delib-erately insulated into sections. A low voltage bridge circuit is used to detect the short between the two tracks. The reason a bridge is used is to compensate for ground leakage due to wet ties.

A stretch of track behind your house might make a great shortwave recieving antenna but it would be a real bugger to load!

BTW track maintenance gear has insulated wheels so that they don't trip the detection circuitry.

Source record: 48668

Ref: My (kd5vu) posting "Wimpy AFSK Output TS-450S"

First, the problem is HISTORY and the TS-450 and PK-232 are working great.

The following are my notes on how to interface a PK-232MBX to a TS-450S/AT
for FSK Operation. These notes are based on tips and notes from Richard
Stuart,
WF7A, from AEA. Richard really helped and I appreciate AEA's technical support
to old customers as well as new customers. BUY AEA products!

You need two wires from the PK-232 (from J7 and J7) to one ACCY2
port on the TS-450S/AT. The following are the connections:

PK-232MBX to TS-450S via ACC-2 Connector for FSK

PK-232 (J-6) TS-450S/AT (ACCY-2)
=========== ============
Pin 5 RED PTT Pin 9 PTT
Pin 4 BROWN GND Pin 8 GND
Pin 3 BLACK - Not Used
Pin 2 WHITE AFSK-OUT Not Used
Pin 1 GREEN AFSK-IN Pin 3 AFSK-OUT
Shield Pin 12 GND

PK-232 (J-7) TS-450S/AT (ACCY-2)
=========== ============
Pin 4 FSK-R Pin 2 RKT
Pin 2 GND Pin 12 (shield)

Forget about even trying to run the TS-450 in AFSK. Go FSK
and you will not have problems. The TS-450 is hosed for AFSK.
Don't waste your time or money on a phone call to Kenwood for help.

If you have a TS-450, I suggest you SAVE this message.

>user only needs a receiver for 1 of the bands. This could be a $100 or less
>scanner for 440 MHz.

I don't really think you could use a scanner for 56 kbps rx. More like
a demodulator and a downconvertor. However, since the Hamtronics
downconverter is only about $50 to 75 it's still pretty cheap.

The trick is that full duplex really doesn't buy you much improvement
in performance, for a multi-user network. If you are all sharing
the network, then you have to take turns transmitting. Full
duplex will allow you to determine if you have collided with anohther
transmitter and thus stop transmitting sooner and free the channel
quicker. If however, you want to do something like a multi-point
video conference using something like CUSeeME full duplex would
not buy you as much as increasing your data rate by 3 or 6 db:-)

Full duplex repeater is a must, but half duplex user stations
are not really that much worse off from full duplex user
stations. Fast aquisition, and lock up time of demods would
also probably buy you more improvement than full duplex user
stations. A nit with the GRAPES-WA4DSY modem, mine needs about
10 or so mSec preamble or it starts loosing lots of packets.
A couple of the guys here have modified the PLL's to bring it
down in the 2 mSec range though.

56 kbps is cool but getting old. With applications like Mosaic,
CUSeeMe, and other interactive whiteboard sorts of software
out there - 56 kbps seems like 1200 baud did 7 years ago when
I got my first TNC .. neat but too slow. It's time to start
pushing the envelope some more ... What is needed now is a cheap
easy to build and align 1 Mbps+ modem!

Report No. DC-2613 ACTION IN DOCKET CASE June 15, 1994

AUTHORIZATION OF AUTOMATIC CONTROL FOR HF DIGITAL COMMUNICATIONS
IN AMATEUR SERVICE PROPOSED
(PR DOCKET 94-59)

The Commission has proposed amending the amateur service rules to authorize automatic control of stations transmitting a digital emission on the High Frequency (HF) amateur service bands.

This action was requested in petitions filed by The American Radio Relay League, Inc. (ARRL), and the American Digital Radio Society, Inc. (ADRS)

The propagation characteristics of the HF bands allow for long distance communications. Amateur operators take advantage of these characteristics to communicate with other amateur stations all over the world. Establishing and maintaining a HF communications link, however, presents operating demands not encountered on the Very High Frequency (VHF) and higher frequency bands. The variables affecting communications in the HF bands are highly complex. To maintain the communications link and avoid causing interference to the communications of other amateur stations, the control operator constantly monitors the activity on the channel being used and adjusts the station's transmitting parameters as needed. Because the presence of the control operator has been necessary for proper operation in these systems, automatic control of an amateur station that is transmitting on any HF band or on the 160 meter MF (medium frequency) band has not been authorized.

In 1986 the Commission authorized automatic control of amateur stations transmitting digital communications on the VHF and higher frequency bands and indicated it was interested in authorizing automatic control of stations using the HF bands.

To determine solutions to the problem of avoiding interference from automatically controlled HF digital stations the ARRL conducted a successful feasibility project under special temporary authority the Commission granted to 50 amateur stations. The ARRL's petition is based on the results of that study. The ADRS's petition contained an additional recommendation from amateur operators who have been experimenting for several decades with digital communications on the HF bands.

The Commission said it was gratified by the cooperation and dedication of organizations within the amateur service community in determining the conditions necessary to allow automatic control of stations transmitting data and RTTY (narrow-band direct printing) emission types on the HF amateur service bands. It agreed with the petitioners that automatic control of amateur stations in the HF bands can, with safeguards, make the transmission of data and RTTY emission types practical and effective.

Therefore, the Commission proposed to authorize automatic control for stations transmitting data and RTTY emission types on one specific subband of each HF band where such emissions are authorized. It also proposed to authorize communications between a locally or remotely controlled station and an automatically controlled station on any frequency where data and RTTY emission types are otherwise authorized.

The Commission said that it firmly believes in the principle that government should be responsive to user needs. It noted that the rules it proposed were the result of a successful feasibility project planned and carried out within the amateur service community and represent the recommendations of two organizations dedicated to bringing the benefits to be derived from the transmission of digital communications on the amateur service HF bands to amateur operators in the United States and elsewhere without causing unnecessary interference to other types of communications.

Action by the Commission June 13, 1994, by Notice of Proposed Rulemaking (FCC 94-171). Chairman Hundt, Commissioners Quello and Barrett, with Commissioners Ness and Chong not participating.

Hi. I've just joined Internet through Delphi and noticed the comments on the KPC-9612 (new Kantronics 9600/1200 TNC). I don't know how often I'll be on here but I am the Test Engineer for Kantronics. The new KPC-9612 is not a G3RUH clone, it's an MXCOM chip (MX589 to be exact). The HDLC is done if firmware, as most of the Kantronics TNCs are. The Data Engine is the one exception with an 85C30 SCC doing the dirty work.

The new KPC-9612 is fully compatible with the G3RUH systems, and I've been testing it on the air against the Data Engine. The KPC-9612 has been connected to many different types of radios and works well with most of them. All of the new generation radios exhibit a slightly long TXD, but they are fully synthesized units.

I'm hesitant to give pricing here, but the paperwork for FCC certification is on someone's desk in Washington, and as soon as it comes back, the unit will be shipping. Hopefully that will be around July 10 or earlier.

Hope that helps.

Just to note, the block system isn't really modern. Been around for almost 100 years, i believe. Want to say since 1868, but not sure (hey, if they could have fax machines back then, I am sure they could do block control) Certain RRs do mandate that maintenance equip not shunt the track, while others require it. I think Union Pacific now has equipment that shunts the tracks since it is a bit safer in teh long run. The Burlington Northern doesn't, tho I met one guy whos vehicle shunted the track if he steped on the brakes and gas at the same time or so -- advantageous for tripping crossing guards, etc.

If we assume that railroad track are all connected and excelent transmision
lines with loss of 1 db per mile they still have more loss than signals
in air and would quickly loose all the signal to loss. Also they would
be very long traveling wave antennas and if they worked they would be
highly directional.

From a CANADIAN PRESS article of Friday 17 June 1994

PHONE SCANNERS LIKELY TO BE BANNED

OTTAWA - Chances are "very high" the government will ban digital scanners that pick up cellular and cordless phone conversations, says Jon Gerrard, secretary of State for science and technology. The Federal advisory council on the information highway is poised to recommend outlawing manufacture and sale of the scanning devices - advice the government is likely to accept, Gerrard said Thursday.
"I think the case was made very eloquently and quite convincingly", he said at the conclusion of the councils second full meeting. The 30 member council, appointed this spring, is advising the government on the so-called information highway - the burgeoning web of telephone, cable, satellite and computer networks.

SECURITY ISSUES: " The Government is very concerned about privacy and security issues," said Gerrard, who attended the two-day meeting. There are more than one million cellular phones, well over two million cordless phones and some 900,000 analog scanners across Canada.
The wireless phone industry is shifting to digital signals that can't be picked up by cheap analog scanners.
But some are concerned that scanners capable of decoding digitized voice communications could soon become common in corner electronic stores.
Legislation would nip the new breed of scanner in the bud , said Gerrard.
"There's no point in people investing money developing commercial digital scanners if that's the direction were going to go," he said. "And I suspect , based on the recommendations of the council, that the chances of that are very high."

1983. GTOR evaluation/update?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-17 13:48:58 UTC
From: rogjd@netcom.com
Message-ID: <rogjdCrJnpn.Hxq@netcom.com>
Source record: 48675

I'd be interested in hearing about your evaluations of GTOR versus Clover or Pactor. How is this new mode working out?

I am on a budget due to starting school soon, so cannot afford to buy a new TNC for a bit. So I'll not be running GTOR until it comes out for the PK-232. Anyone know where we are on this?

There is quite a bit of controversy about how effective an improvement GTOR is. Kantronics makes some pretty heady claims. On the other hand, I've read some Internet posts which say otherwise.

The proof of the puddin' is the eatin'! What are you all finding out?

I'd be interested in reading your opinions.

1984. TEKK KS-900 interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-17 15:24:10 UTC
From: ae517@FreeNet.Carleton.CA
Message-ID: <CrJs4A.931@freenet.carleton.ca>
Source record: 48677

Just xtal'd up my KS900 in anticipation of our new 9600 bps repeater at ve3ocr.

I've seen recommendations of putting a resistive attenuator on the TX line coming from the modem to bring it down to about 50mV, which I plan on doing. However, should I also stick a 5-10 uF non-polarized cap in series as well? I've read in the manual that the g3ruh wants to see about 500 ohms, or a "chirp" could result on key-up.

As well, the TEKK manual says this rig runs from 9.6 to 11.5 volts. I want to be able to run this rig portable with a 12 volt gel-cell. I was thinking of putting approx. 1 ohm resistor in line to drop the voltage below 11.5 volts on transmit. (lazy man's voltage regulation 8^).
Is anyone running the TEKK from just plain 12 Vdc?

any advice would be appreciated

tnx de va3rr

The DRFS-xxxx parts were made by Digital RF Solutions. DRFS got
absorbed into Proxim Corporation (in Mt. View, CA) which is very much alive,
however I'm not sure if they are marketing the NMCO stuff any longer. I've got
some app-notes/data sheets on a lot of the DRFS parts. If you would like me to
see if I can find them please e-mail.

I also would be interested in hearing reports from those who've tried
these different protocols. But I must say, from the evidence in front
of me, it looks like Clover, available only in the IBM PC plug-in board
from HAL, is going to have a miserable time against a protocol available
in a standard outboard TNC unless its technical advantages are just
overwhelming. Add on that the HAL board is far more expensive than
the KAM Plus w/ GTOR and it's Marketing 101: Clover has no possible
chance against GTOR: the price and configuration disadvantages of the
HAL product make its success completely unimaginable to me.

No surprise, if you call up any of the ham equipment stores and ask
for a recommendation (which is really the same as asking what sells
the most, usually) the answer is the KAM Plus, no question.

1989. DCD mod from TAPR

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-18 05:10:05 UTC
From: jchandle@netcom.com
Message-ID: <jchandleCrKuCu.B2D@netcom.com>
Source record: 48683
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I just finished installing the TAPR DCD mod in my 1270B. I wish that I would have gotten it long ago, it's GREAT. It allows you to run your TNC radio unsquelched so the DCD circuit is only active on a valid packet signal. I highly recommend it.

That is exactly the point. If G-TOR is anywhere near as good as Clover
(or Pactor II, when it arrives, which will also require new hardware)
then there is little reason for anyone to migrate to Clover/PactorII.
GTOR can be a simple firmware upgrade for pretty much any multimode TNC,
at nominal cost.

There has been a fair amount of technical discussion regarding whether or
not GTOR really does deliver on the claims made by Kantronics (Don't ask
me :))

But would sure like to hear from actual GTOR users who have had the
chance to really determine how it compares to Amtor and Pactor.

When are people going to realize that if you want privacy, don't use a mode of communication that sends your conversation out into the ether? The cellular phone mfgrs and companies are aiding in continuing the ignorance of the public about the lack of security of cordless communications. They would rather make listening illegal than risk having to tell their customers that using a cellular or cordless phone is like talking to your next door neighbor with a bullhorn, or actually having to find a way to encrypt their signals to prevent off-the-shelf receivers to listen to them.

Message-ID: <9406181743.AA17623@iris.csci.csusb.edu>
Source record: 48685

In a former treatise, Ham-Digital Mailing List and Newsgroup spake thusly:

-> Modern railays use "block control/detection" for location of trains. This
-> system relies on the the fact that a railroad train can be a moving short
-> circuit. This fact is detected for block detection and to signal level
-> crossings of the presence of trains. To do this the rail system is delib-
-> erately insulated into sections. A low voltage bridge circuit is used to
-> detect the short between the two tracks. The reason a bridge is used is
-> to compensate for ground leakage due to wet ties.

At road grade crossings, the track is shunted at a certain distance from the
crossing on both sides of the crossing. A constant-current low frequency
sine wave signal is fed into the track at the crossing, and the track acts
as a BIG inductor. When the train crosses the shunt, it is now a rolling
short, making the inductor smaller and smaller as the train gets closer
to the crossing. Equipment in the wayside box monitors the phase and voltage
of the track signal and computes not only how far the train is away from
the crossing, but also how fast its going. The gates always come down at
X number of seconds before the train gets to the crossing. When the train
passes the crossing, the rolling shunt is moving away now, and the box
detects this and brings the gates up immediately. The gates also come
up if the incoming shunt reduces it's speed to less than 3 miles per
hour or so.. There is an "island" around the immediate area of the
crossing where the gate will always stay down if the shunt is within the
island, regardless of speed...

To make all this work, especially where there are many road crossings
close to each other, insulated joints and various track frequencies,
as well as tuned shunts, notch filters and peak filters, .etc are used.

A radio signal wouldn't go very far in this environment..

->
-> BTW track maintenance gear has insulated wheels so that they don't trip the
-> detection circuitry.
->

1993. AEA MBA Code Reader Input Wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-19 03:07:25 UTC
From: leigh@rain.org
Message-ID: <leigh.771994800@coyote>
Source record: 48688

Recently I bought a used AEA "MBA Reader" without a manual, and would appreciate any hints and input on how to use it.

Thus far I've been able to decode some CW and one RTTY transmission. The RTTY was on 20 meters, and the MBA was set at the "60" setting.

Can it also decode AMTOR/SITOR and 300 baud HF packet? If so, how?

For CW, I don't think it works quite as well as a PK-232 I've used.

The most logical way I've found to use it, is to turn the "threshold" adjustment untill both LEDs go out, and then find a strong signal, and then tune the signal so both LEDs are of equal brightness. Is this correct??

Thanks and 73 from Leigh/KM6JE.

PS: BTW, I paid 30 bucks for the "MBA": is this reasonable?

I have one of the new KAMPlus with both. I really haven't seen much of a difference between GTOR and Pactor, but I've only tried it on two contacts so far, and only in conversation mode. I haven't had the time to transfer some medium size binary files to see it works any better.

Obviously an oscillator would be a fantastic way to check your
crystal. In factr, given the circumstances, if you dont have really
good test equipment, it is probably the best way. Another way you
could test the crystal would be a with a sweep generator that is
capable of going up to well beyond the frequency of the crystal, and
by using a spectrum analoyzer and a generator, you should be able to
sweep through the frequencies, look for the peak output and then
determine the center frequency.

Build the oscillator though... simplier... :)

The freq counter should be accurate enough, you have to find a buffered
point to pick off the signal, otherwise you'll pad the crystal oscillator
and throw it off frequency a bit if you go directly to it.

2000. Re: GTOR evaluation/update?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-19 21:56:01 UTC
From: sww@csuohio.edu
Message-ID: <1994Jun19.215601.12792@news.csuohio.edu>
Source record: 48494

Having tested both Pactor and GTOR over a number of environments, it is plain that although GTOR offers superior performance, Pactor is more reliable.

We do quite a bit of camping. When camping, we connect back home through a number of BBS ports that support Pactor and GTOR. In two systems, two KAMs were placed in parallel with one on GTOR and one on Pactor. A number of weeks have been spent then getting back to the systems from remote locations.

On an eighty meters 200 mile path, GTOR was fantastic when the band was in good to excellent condition. We typically had to stay at the terminal to read the data that was flowing through. The rate of data flow was high enough to be at the limit of reading it as it came in. However, over that same path, Pactor was found to be more reliable. When the band was opening or closing, GTOR would just not link or would do so only on stations that were not scanning. Pactor would link fairly quickly and the link would hold. Data flow once linked would show Pactor throughput to be higher than GTOR. As much of our operation is on 80 meters as the band opens and closes, Pactor is the mode of choice for those limited to one TNC.

I don't think that this would be useful for the frequencies used for
comericial radio, but the Pensylvania RR did use inductive train phones
that used low frequency signal passed through the rail. The antennas
looked like hand rails on top of the cars and locos. This worked very
well for the trains, but the equipment was not at all portable, and
propigation away from the tracks was very poor.

>and throw it off frequency a bit if you go directly to it.

>Andy N3LCW

Well, sorta. You have to know whether the crystal is cut for a parallel resonant mode (if so what parallel capacitance) or a series mode. Then you build a leetle oscillator that is appropriate to the crystal's mode and measure it. That tells you a little bit about the crystal. Howsosomeever, crystals are sensitive to the amount of drive you place on them, temperature (of course), pressure, etc etc. Um, just how acurate must it be? If a couple hundred parts per million are enough then a rude-crude CMOS or TTL oscillator should do. If you need it characterized to the nitties and gritties you have a whole nuther ball of fish to fry. (Hm, could I mix that metaphore worse?)

An ideal way is a VERY stable network analyzer. Place the crystal in a well calibrated fixture in shunt with the line. Slowly sweep til you see a small dip. Note the frequency and the amplitude. Then place it in series. Note the peak and dip as you tune. Then build an equivalent circuit from the results. Repeat it with higher drive levels until you see the crystal frequency change noticeably. Do not drive it within 10dB of that level if you want REAL stability. Of course, if you need this level of accuracy you're playing serious engineer and know how to do the math. Yer on yer own here. It is too long since I limped through some of this for characterising some VXO crystals. (It DOES work. The resultant VXOs very closely matched predictions, right down to when the spurious resonances would kick in and become a PITA. Your measurement WILL see them if you do it VERY patiently.)

2004. WA8DED rom wanted gor v2.6 need higher

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-20 11:11:55 UTC
From: J.Verhoeven@nw.hse.nl
Message-ID: <J.Verhoeven.6.2E05797B@nw.hse.nl>
Source record: 48500

Hello,

I have a tnc2 with a rom that contains wa8ded v2.6 and tapr 1.1.7.
I have discovered that the software has some disavantages.
Example:

when receiving frame 2 and 4 the tnc sends a RR3 (receiver is ready to
receive frame 3). after frame 3 has arrived it sends a RR4. But frame 4 is
has already arrived correctly. The tnc should have send a RR5 (ready fore
frame 5).

The software that I use with my baycom modem does this correctly. It saves a
lot of bandwith because correct frames aren't transmitted again.

I asume that this function is already built in in newer version of wa8ded
hostmode software. I have version 2.6 at the moment but I have read postings
of people talking about 6.6.4.

My quest is the search of this new software.
Where can I find romimages of this new software or where can I buy it??
(btw. I live in the netherlands europe, so obscure stores in singapore are
out of the question. unless the have internet access).

More information about wa8ded is also very nice I got a document that talks
about v0.91 and I use v2.6 so there is probably a great difference.

2005. MFJ 1274 - Info wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-20 11:23:14 UTC
From: ijg@oiiag.demon.co.uk
Message-ID: <772111394snz@oiiag.demon.co.uk>
Source record: 48499

I have recently bought an MFJ1274 TNC. All working well. But thought
that it should have MAIL facility. I couldn't find anything in the
User Manual that referenced MAIL (having scanned it several times).

Eventually, while in QSO with a friend, he suggested trying to type
'MAIL ON'. Suprise - suprise, it accepted it and presumably enable
the mail system. Why is such an important feature undocumented ?

However - I am new to packet and in need of advice as to how to use
my TNC's mailbox, e.g reading it! Can anyone please enlighten me ?

The specification on the box and when the TNC powers up, is that it
supports FAX and BPL (what's BPL??). Does anyone know how to use
these from the MFJ1274. I have a couple of FAX progs, e.g. JVFAX
and WEFAX, but not sure whether I can use this TNC with these progs.

Would be very grateful for ANY info - especially any other undocumented
command !

Life used to be so simple with a morse key !!!!

The trainphone system was basically a huge air core transformer, using existing line side wire (including catenary, where present) and the rails to form the coil. The frequencies were in the 30-50KHz regions.

>The antennas looked like hand rails on top of the cars and locos. This worked
>very well for the trains, but the equipment was not at all portable,
"walkie talkies" with antennas as 4 foot dia hoops (to be carried strung over the shoulder) were tried. Not popular with crews. Useful installations on locos, cabees (errrr_cabins_) and wayside.

> and propigation away from the tracks was very poor.
A feature. RR business stayed private.

What are you going to do with the crystal? If you'll be using it
in an oscilator and you need it to be accurately measured, build the
oscillator (see TTL databooks for a good circuit) and measure that.
If you're using it for a crystal filter, you more likely need the
series resonant frequency (the TTL oscillator is parallel-resonant,
and typically a few kilohertz higher in frequency, and changes with
varying capacitance). Series resonant can best be had by using a
signal generator and an oscope. If this is what you need, write me
for details (won't waste bandwidth this way).

> ***** Actually, as I remember it, typical practice is to use a separate inductive loop
> under the track. Seems that there's something about trains that can cause a large
> inductance change when they pass overhead :-).

Actually, it's the other way around; signals from the inductive loop under the track are picked-up by a small coil mounted on the locomotive. This system feeds the block-occupancy information from the track circuit to relay-logic on the locomotive. The signal indication is relayed in the cab of the locomotive. If the engineer does not acknowlege the signal indication (by pushing lever) and respond appropriately (by observing the appropriate seed restriction for the signal indication), the logic applies the emergency brakes.

This system and variants were a result of a federal regulation (ICC or FRA - I forget) that allowed higher speeds if such automatic safeguards were implemented.

There are a lot of Wnos users using it successfully whith Baycom modems
(the local amprNet bbs also uses a Baycom to the 1200 bauds port).

To get in touch with the guys that use Wnos&Baycom, subscribe
the Wnos discussion list. Send a mail to:

ListProc@edugraf.ufsc.br

with content:

SUBSCRIBE WNOS-L <your name>

If you don't have Wnos, give it a try... It seems the best choice to a
end-user host with Baycom.

Download it from the anonymous FTP server:

FTP.edugraf.ufsc.br

There you'll find most of Wnos (sources and exes):

Wnos4a8, Wnos4a9, Wnos4a9p, Wnos5, Wnosbeta0

> 73 Dave WB0GAZ dgf@netcom.com

Dave,
I've run a couple of 9600 bps links on 70cm for about 2 years now. The first was an old TAPR TNC1 with 9600 bps modem and a Tekk 900 radio. The modem was the real problem. I then upgraded to a DataEngine with Kantronic's 9.6/19.2 modem. That worked quite well. I added a second DE with 9.6/19.2 modem and a Kantronic's D4-10. That was truly plug and play. The D4-10's 10 watts out was a nice improvement on the 15 mile hop I use it on. I did have a problem with the D4-10's frequency drift until Kantronic's installed a modification and replaced a bad cap. I recently replaced the Tekk 900 with a Tekk 960 which is told to have better frequency stability. I can not say that it has improved things, as the link is quite reliable generally.
The groups I belong to has also installed a full duplex bit regenerator "repeater" operating at 9600 bps using TAPR's 9600 bps modem and a MFJ tnc. That works quite nicely. The rcvr is actually a Tekk 900, while the xmtr is a motorola.
Completely packaged radios and tnc's though I have no experience with.
I hope this helps.

Regards,
Bill, kb2cq

2028. Where current KA9Q TCP/IP Software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-22 00:09:16 UTC

2029. DRSI 2 card and G8BPQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-22 06:35:01 UTC
From: tom@hekla.Systemtechnik.TU-Ilmenau.DE
Message-ID: <2u8m2l$sdc@prakinf2.PrakInf.TU-Ilmenau.DE>
Source record: 48524

Using a DRSI2 card together with G8BPQ node software (and PacketCluster)
I mentioned a small problem:
the configured txdelay for the ports are not recognized - txdelay always is set to 1.
Using the sysop-utility one can check and set this manually. But that parameter
should be recognized correctly ! Is it a bug or a feature, hi ?
Any hint is welcomed !

There have been some interesting applications developed but they are
few and far between. I have an oscilloscope program that Brooks gave
me a year or so ago (but I don't know whether it is available for
public distribution). Also right now there are some audio filters
posted on Ko-23. I've not tried them yet but they look interesting.

: Is firmware version 2.0 the latest?

yes
: Is the AEA DSP
: unit programmable and if so are programs written for it compatible
: with the DSP-12? Any info or opinions welcomed.

They are not compatible... if I'm not mistaken it even uses a different DSP
chip.

You may or may not know that LL Grace has a developer's kit for sale for
$25. I know Brooks has been puzzled as to why there has not been more
development activity. One reason, I think, is that there is no way to
upload additional programs to the unit. If you upload new firmware it
replaces what is in ROM, it doesn't augment it. So you go through an
upload proceedure to put an additional program in, but the next time you
want a 9600 baud modem you have to default to the ROM, but if you want the
new program you have to upload it again. You really have to think twice
before deciding to upload

Another aspect of the TZ environment variable is that with most versions of DOS it will not take effect unless it is defined ahead of the path and/or prompt statements in your autoexec.bat file. What you want to do specificly is add a line near the beginning of your autoexec.bat file that says:

SET TZ=CST6CDT

When PC-Pakratt II finds this environment variable and the date your computer is set for, it automagicly determines if the 'daylight time' correction is needed instead of the 'standard time' correction.

2041. NET_Mac2.3.41.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-23 10:41:23 UTC
From: adam@iag.TNO.NL
Message-ID: <9406231041.AA04644@iggcis1.igg.tno.nl>
Source record: 48533

The Netherlands, June 23, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.41.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Allow recording of finger-sessions to a file
- Mods to prompt for username and password (FTP)
- Truncate hostnames that are too long to be printed
- Fixes for AddResMenu() bug in System 7.5
- Password-protect 'remote <hostname> reset' command
- Make sure NET/Mac doesn't leave a watchcursor on the screen
- Change double linespace to single space in TRACE-files
- Create new TRACE-files only when the traceflags are nonzero

This version obsoletes all versions of info-mac/comm/net/radio-netmac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
1) ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

It may have also been uploaded to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards,

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

2042. new HAMCOM interface with optical isolation

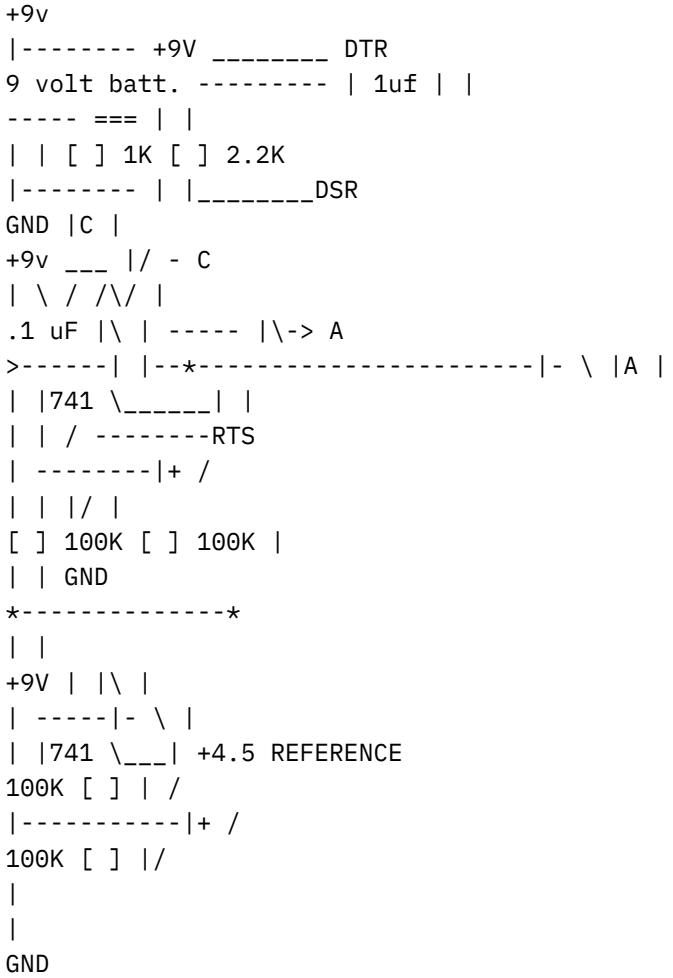
Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-23 15:08:48 UTC
From: copeland@metronet.com
Message-ID: <CruvEo.4y8@metronet.com>
Source record: 48538

Here are two opto circuit I've been playing with for HAMCOM/JVFAX.
They virtually eliminate all computer induced rfi. I've been using
a five foot serial cable and twenty foot audio cable with this
circuit and the results are truly remarkable with JVFAX.

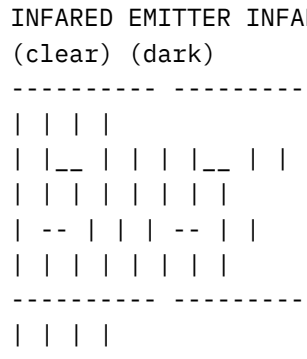
I've used the first circuit successfully, but recommend using the second.
The first can be built with common Radio Shack parts. The second requires
a little more uncommon LM358 and TIL181. The Radio Shack opto RECEIVER
is only rated at 20v but used at 24v and could eventually burn out.
It also may introduced problems since the +9v is not regulated and induces
error into the reference op amp output ... even though it seems to work well.

Perhaps some engineers out there may have some advice.

==========



==========

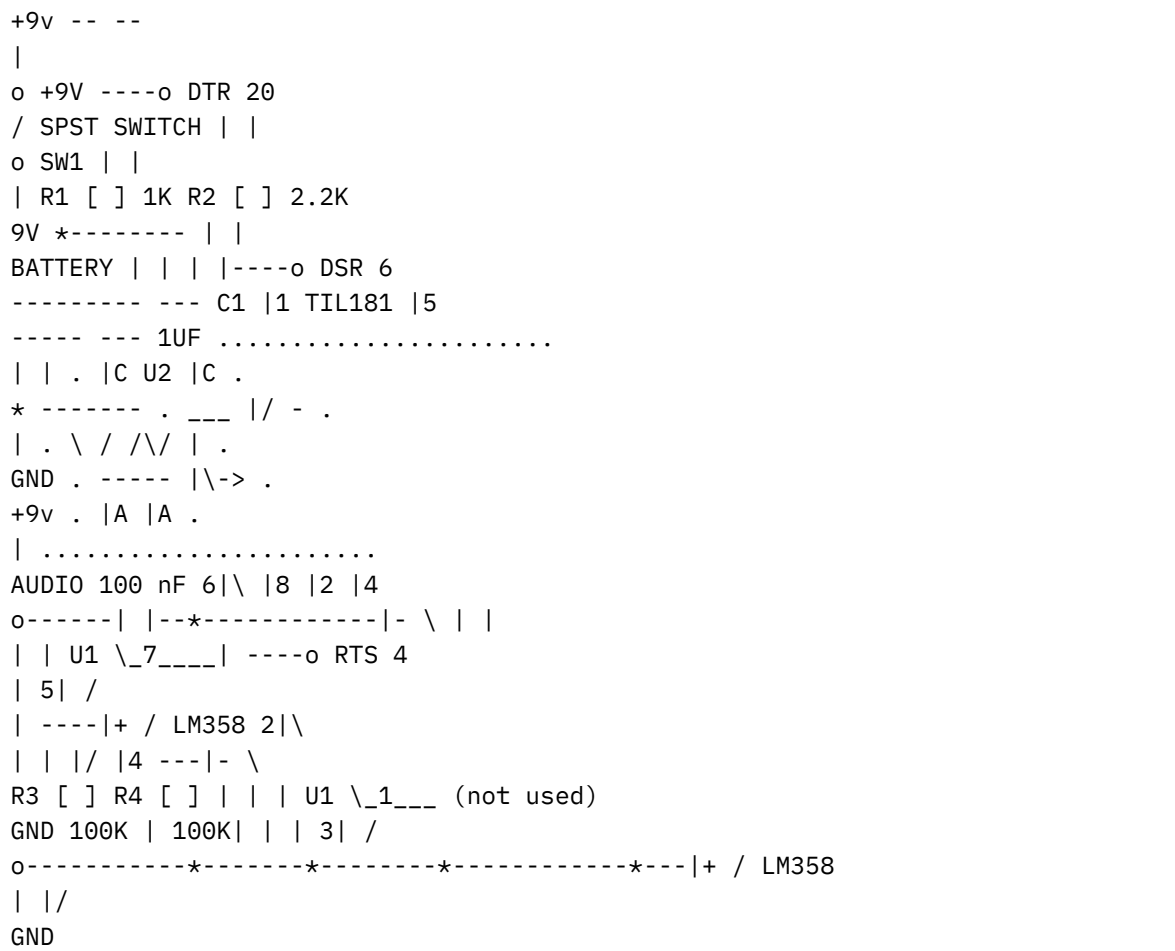


These are available at Radio Shack as a pair for $1.99 (#276-142).
This shows which is the Anode and which is the Cathode, not clear on
the package.

The LED and DETECTOR must be positioned right up against each other and
exactly aligned to get maximum light transfer. The sides with the little
lense like dots must be placed together.

==========

I'd recommend this second circuit for more stability and possibly accuracy.



```
================================================================================
| ** NOTE** |
| After constructing, measure LM358 pin 7 with no audio on the input. |
| It should be high (~8v), if it is low (~0v) it will drain the battery |
| in only 20 hours or less. |
| |
| To correct this: Disconnect R1 from +9v and reconnect to U1 pin 7. |
| Disconnect U1 pin 2 and reconnect to GND. |
| |
================================================================================
```

The LM358 is a single supply opamp and can be substituted with the LM2904, LM158, or LM258. (The dual supply 741 can not be used as a substitute.)

The opto isolator IC can be substitued for many other types. The 4N35 has been tested successfully. The discrete infared emitter/detector from Radio Shack has been tested successfully.

I tried to use a darlington opto (TIL113), but couldn't get it to work. A darlington opto circuit would only require 1.5ma average. That would make battery life about 133 hours. Maybe I'll try again later.

```
================================================================================
```
MORE NOTES:

The 9v battery could be substitued with a 9 or 12 vdc adapter. However I've found the clearest pictures occur when both the radio and HAMCOM are running off batteries ... at 6am 8).

A 9v battery should last about 50 hours while audio is present (assuming 200ma hours for a battery). If no audio is present the battery will last 400 hours.

The battery life could be a problem for people who leave HAMCOM running all night using the timed FAX option. Battery would only last a week.

If you have any advice or knowledge that could improve this, please let me know.

Source record: 48537

>What's packet radio and how does it work? Does it let you connect to the
>internet? Is it expensive?

sounds like you might need more of a backgroud....

for starters call the American Radio Relay League at 800-32-new-ham and ask
for the prospective ham package.

2nd look at a publication called "Now You're Talking" produced by the ARRL and
available at places like Radio Shack -- this will cover some of the basics.

3rd look at a video tape produced by the guys at CQ Magazine called "Getting
Started in Packet Radio" (if available).

if you want protocol details there are several documents that get into the
meaning of the bits and all that.

there are content restrictions for amateur radio. so the answer is "no, packet
radio doesn't let you connect to the internet at this time".

Expensive is relative. if you have a computer and the right software then you
can have a cheap dumb modem. if you want "serial device independance" where
you can use any RS-232 serial device with the packet station, then you are
looking for a terminal node controller...

that should get you started...

I seem to remember a while back some talk about using the INTERNET
to provide wormholes to remote places. I even seem to recal that
this capability was built into at least one version of NOS. Can
anyone tell me where I can find out about this?? Are there any
exotic places offering NETROM Nodes across the INTERNET?? Sure
would impress the local ham community if I started running NETROM
on my NOS box and had some european or australian Nodes in the table
that were actually reachable.

Any information would be greatly appreciated.

2047. Using TS-850s with PK-232?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-24 18:56:59 UTC
From: rs2@tntvax.ntrs.com
Message-ID: <1994Jun24.135659@tntvax>
Source record: 48542

I wondered if anyone has experience in connecting a Kenwood TS-850s to an AEA PK-232 controller?

Pins 3 and 4(ground) on accessory plug ACC2 are recommended as the source of the audio signal FROM the 850 TO the PK-232. I might be mistaken but I don't find the level of that signal sufficient to drive the PK-232.

If you have any experience connecting these two units, I would appreciate your comments.

Please send responses DIRECTLY to the address below. Thank you.

The developers kit was more expensive when I purchased it. Also, it doesn't include any modems (except for a test one I think). The only sample code is the V40 code, not DSP code.

Does this filter work in the IF stage? A friend of mine says it has wires going into the rig, so I suspect it works in IF rather than AF. Also, will it work with the TS 450? One more question, is it as good as the Timewave products, or any of the other good dsp's out there?

TAPR has a 9600 bps modem in kit form whic will plug into the disconnect header on the TNC-2 circuit board. It can be used with a switch to go between 1200 and 9600. The kit price is $80 US plus shipping. For shipping info or to place an order, contact:

David,

The G3RUH 9600 modem kit is freely available in the UK. I've seen it advertised in RADCOM recently.

I've got a unwanted board with instructions if you want to mail me bigwood@cmopma.enet.dec.com. I'm also QTHR and in phone book.

2058. GPS group purchase shutdown

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-27 17:25:53 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <2un231$4go@nntpd2.cxo.dec.com>
Source record: 48551

Greetings, all.

As I have not achieved critical mass in the number of orders for the Motorola GPS engines, I am shutting down the group purchase.

I am on vacation for the next two weeks. If, upon returning, there has not been enough orders received to reach the magic 100 mark, I will be returning the checks to those who have sent them to me, and discontinuing any efforts in this area. As of now, I have orders for about 35 units. For those of you interested, that's about $13,000 sitting on my desk.

Thanks for your time, efforts and wonderful interest in this matter.

Regards,

Tom Bonomo

TAPR INTERNET INFORMATION - UPDATE

------------------------------------------------------------------------

TAPR SIG Archives

The TAPR SIG mail exchange archives are being made available via FTP access.
system: tcet.unt.edu (129.120.20.191)
directory: tapr/SIG

-----------------

TAPR Internet Mail Groups

TAPR's SIG groups are very active and all are welcome.
Current mail groups include:

o BBSSIG is the mail group for the BBS Special Interest Group
o NETSIG is the mail group for the Network Special Interest Group
o TAPR-BB is the mail group for TAPR bulletins.

To subscribe to these lists, send mail to 'listserv@tcet.unt.edu',
include in the message body the command:

join groupname

Example:
join bbssig
join netsig
join tapr-bb

When you get tired of one of these groups the command to remove yourself is:

unjoin groupname

Example:
unjoin bbssig

To get more information, send Internet mail to 'listserv@tcet.unt.edu' and
include in the message of the body the command 'help'.

-----
```

TAPR FILE SERVER

The orginal TAPR file server remains on-line and available for use.
'file-request@tapr.org' can be used to access TAPR's file system.
The electronic issue of the PSR (Packet Status Regiester) is now being made
available via the server as a file. If your club editor is looking
for packet articles and information to republish this is a great source.
To get more information, send Internet mail to 'file-request@tapr.org' and
include in the message of the body the command 'help'.

FTP Access

The TAPR Software Library is available via anonymous FTP. You can
access the library by ftp access to 'ftp.hereford.ampr.org' in the directory
pub/hamradio/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Hi Greg;
I'm somewhat relieved to find I'm not the only one encountering dificulty
compiling JNOS under Borland C++ ver. 4.0... Like yourself, I too
have resorted to using version 3.1 to compile JNOS. It occurs to me that
a possible solution would be to construct an IDE project file for
compilationunder ver. 4.0, an enormous task. Whats more, ver. 4.0 IDE will not
debug
a dos program dirrectly, and would require the use of the Borland

In any event, if you should discover a better way, I really appreciate
hearing from you. If I come up with anything, I gladly let you know.

2064. NET_Mac2.3.42.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-28 19:10:50 UTC
From: adam@iag.TNO.NL
Message-ID: <9406281910.AA07032@iggcis1.igg.tno.nl>
Source record: 48558

The Netherlands, June 28, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.42.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

I believe I made some slips-of-the-pen in the 2.3.41 FTP-mods...
Although I have not been able to reproduce all of the bugs that were
reported, I still hope, that 2.3.42 cures those...

In this version of NET/Mac I implemented the following:

- Fix for mods that prompt for username and password
- Support 'rdate' command (see HELP-info)
- Fix error in TRACE-output, introduced in 2.3.41

This version obsoletes all versions of info-mac/comm/net/radio-netmac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

It may have also been uploaded to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards,

Adam PA2AGA (e-mail: adam@iag.tno.nl)
(or: pa2aga@iag.tno.nl for letters only, NO BIG files here)

2065. ARRL Digital Conference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-28 21:19:16 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9406282015.AA29120@ATK.COM>
Source record: 48559

Subject: Time:3:13 PM
OFFICE MEMO ARRL Digital Conference Date:6/28/94

The deadline for submission of papers for publication in the Proceedings of the 13th annual ARRL Conference on Digital Communications has been extended to July 5, 1994. Papers should be submitted to: Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via Internet to lweinber@arrl.org. It is not necessary to present the paper at the Conference for the paper to be published in the Proceedings.

So, if you haven't already done so, put your fingers to the keyboard and write-up your software and hardware developments, experimental results, ideas, theories, philosophy, etc., to share with the digital communications community.

The ARRL Digital Conference will be held August 19-21, 1994, at the Thunderbird Hotel and Conference Center in Bloomington, MN, U.S.A. (near the Minneapolis International Airport). The main Conference presentations will be on Saturday August 20. In addition to the presentation of papers, six forums are planned covering digital data methods, DSP developments, HF data methods, TCP/IP developments, ARRL Committee updates, and high speed data transfer.

For more information call Cathy Thomas at 1-800-726-6715 or write to ARRL Digital Conference, Paul Ramey WG0G, 16266 Finland Ave., Rosemount, MN 55068, U.S.A.

I don't know what the difference is, but I could not get JNOS 1.10b to run correctly when compiled with Borland C++ 4.0. Actually, it seemed to come up OK but crashed (hung the system) on exit. Based on this information, I never tried to actually attach any ports or work out the problems. I figured Borland C++ 4.0 expected the stack frames to be unchanged and fixing it would be a major bear.

I grabbed JNOS 1.10d and have been running it for a few weeks. In the interim I ran into all kinds of problems -- users and a local PBBS would intermittently get a 'busy disconnect' from me for unknown reasons, etc. I finally traced that to a bug in iface.c (around line 40 the line ifp->flags += ... should be changed to ifp->flags |= ...). While trying to fix the problem, I compiled JNOS 1.10d with Borland C++ 4.0 with full debugging information (add -v to the compiler flags). For whatever reason it's been running without problems for a couple of weeks. The only changes I've made are to the makefile to select BC4, and I add the experimental mods for F6FBB style forwarding.

2068. Open architecture for HF digital

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-29 17:44:15 UTC
From: forrerj@frl.orst.edu
Message-ID: <forrerj.36.0@frl.orst.edu>
Source record: 48562

Dear fellow digital experimentors,

--- THE NEED FOR AN OPEN ARCHITECTURE FOR HF DIGITAL ---

It has been suggested by several individuals with interests in modern high speed HF communications that there appears to be a need for high speed networking (many users on a single frequency) as well as an interactive mode(half/full duplex between two users). One may argue that such modes already exists, it is however, evident that "proprietary" or "closed" architectures are increasingly finding its way into digital appliances for the amateur radio market. Personally, I do not see any problem with such developments should they have merits in technical excellence -there still remains a need for participation and innovation by amateurs interested and capable of contributing to this fascinating field. Such participation is only possible through an open exchange of ideas. Your sharing of ideas and experiences would be very valuable.

A variety of topics need to be addressed:

1) Modulation schemes: bandwidth, symbol rate, robustness, tuning/synchronization, equalization, scrambling, wave shaping etc.

2) Protocols: ARQ/FEC, coding methods, i.e. block, convolutional, hybrids etc..

3) Development platforms and implementation issues: DSP hardware and software, host hardware and software.

Are there folks that wish to cooperate in such developments? Would this newsgroup be suitable for such discussions - other suggestions that you may have?

Please post here or e-mail me directly.

Thanks in advance.

2072. cheap 4 port dedicated BPQ engine

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-30 15:43:02 UTC
From: djk@dirku.demon.co.uk
Message-ID: <Cs7vnq.78A@demon.co.uk>
Source record: 48567

I have just purchased one a THORCOM MSC800 as a data engine clone and I think that it is quite good value. They are priced at STG 352 + vat.

The box is the same size as a PACCOM Tiny-2 and supports up to 4 Baycom (or Kiss mode) TNCs @ 9600 (it is alleged that greater aggregate speeds are possible). It is essentially an IBM PC (complete with BIOS) with 4 uncommitted serial ports which you can use for whatever you fancy. It make an excellent BPQ node which I am going to use with 3 radio ports (KISS TNCS) and one port connected to the existing BBS PC. The BPQ node software comes in ROM and just boots straight up.

I enclose a data sheet cribbed from the instructions:-

---------- cut here ----------

MSC800 Mobile System Controller

Thorcom Systems Limited have just released a new radio/data comms product called MSC800. The MSC800 is a 80188 target processor board with four RS232 serial channels designed for in-vehicle use for data comms and data processing applications, but also has a wide range of "data engine" radio and data applications.

MSC800 was developed to allow Systems Integrators and OEM/VARs to develop mobile data systems quickly and efficiently and use standard PCs for development work and then place final systems in the field with software running from EPROM.

The MSC800 comes as standard with a 20MHz processor, 128K SRAM and 64K BIOS and ability to add further RAM or EPROM if required. The BIOS contains INT-14 (COMBIOS compatible) drivers for the serial ports and timer support. A set of support routines, written in C, is supplied to provide access to the serial and timer functions along with some example programs including GPS receiver handling.

A version of BPQ AX.25 networking software is available for the MSC800 and supports Baycom type external modems, TNCs operating in KISS mode and NET/ROM inter-node protocol.

------------------------ cut here -------------------------------

They also sent me a data sheet on this dinky little TNC which I haven't tried. It is TINY and will happily fit _inside_ a lot of transceivers.

------------------------ cut here -------------------------------

RLC320 miniature packet radio modem

Thorcom Systems have recently introduced a new miniature packet radio controller/modem called RLC320.

The packet modem supports data transmission at 1200, 2400 and 4800 baud over the radio channel using FFSK audio tones, has two serial ports (one RS232 and one TTL/CMOS) and has a modem disconnect header.

The tiny modem measures only 63mm x 44mm x 10mm and draws under 90mA allowing it to be built in to other equipment, eg. radio transceiver.

The modem is supplied with standard firmware which offers AX.25 level 2, version 2.0, Extended-AX.25 with 16 frame sliding window & selective reject and KISS/SLIP mode.

Other firmware is available to customise the modem for use with GPS core-receivers in Automatic Vehicle Location systems and MAP27 is supported for use on trunked radio systems.

Thorcom expect the modem to find a wide range of applications in both the commercial/industrial sectors as well as use in Amateur Radio.

Further details, etc. from:

Thorcom Systems Limited

as above

IMHO, the MFJ-1278B has good points and bad points. The good points are price and flexibility. On a limited budget it will give adequate performance and allow you to try quite a few different modes.
I should say that I've had mine for over a year and am quite pleased with it. Now for the bad points:
The documentation and software is very poor. I still find things buried in the manual or completely undocumented. If you like surprises and experimentation then maybe this is a good point ;-).
The SSTV portion, although functional, leaves a LOT to be desired. It can only handle 16 (32?) colors and the resolution is poor. I enjoyed using SSTV when all I had was a B&W VGA monitor but as soon as I switched to colour VGA I lost interest.
The FAX software also leaves a lot to be desired although it is functional.
Other than that, for normal RTTY, amtor, pactor and packet is fine although not as good as the new DSP multimode controllers. I also use mine for 9600baud packet with the optional G3RUH modem.

In summary, its worth exactly what they charge for it and is a good starter TNC that will do a lot of things.

2074. 9600 bps Activity in AZ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-06-30 20:30:14 UTC
From: rapw20@email.sps.mot.com
Message-ID: <1994Jun30.203014.20787@newsgate.sps.mot.com>
Source record: 48585
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.digital.misc

Can someone tell me what freqs the 9600 bps packet activity is on in Arizona, preferably the Phoenix/East Valley area? I'd be interested in TCP/IP or 'regular' packet. I just picked up a PK-96 and will be ready to give it a try as soon as I make up a cable. Any info will be appreciated.

Tks & 73... Mark AA7TA

2075. DSP as Packet Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-01 00:42:04 UTC
From: mikej@shell.portal.com
Message-ID: <2uvoos$l6u@news1.svc.portal.com>
Source record: 48569

Is it possible to use a DSP (with an Analog to digital converter) to make a packet modem? I'm sure the DSP could be used as the modem, but is there enough horsepower (I'm planning on using the 56002) to also implement all the other layers to make a full TNC? <Has this already been done?> This sounds like a rather ambitious software effort, and I hoped that someone had already come up with a similar DSP implementation.

Thanks!

mikej@shell.portal.com

+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to Internet E-Mail. Below is the information that is
needed in order to access the BBS via Telephone, please pass it around to
as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.Fast,HST,V.42bis)

410-661-2598 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.Fast,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 1.21g)
Misc. Info: Machine is an 80486-66 running UNIX System V Release 4.2
and features more than 3 Gigabytes of on-line file storage.
Most transfer protocols are available!!
Sorry, FTP access is NOT currently available

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
G8BPQ PC-Node (Version 4.06)
```

Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck, and Enjoy...

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

PR Docket No. 94-59
RM-8218
RM-8280

In the Matter of

Amendment of Part 97 of the
Commission's Rules Concerning
HF Digital Communications in the
Amateur Service.

NOTICE OF PROPOSED RULE MAKING

Adopted: June 13, 1994
Released: June 23, 1994

Comment Date: October 1, 1994
Reply Comment Date: November 1, 1994

By the Commission: Commissioners Ness and Chong not
participating.

I. INTRODUCTION

1. In this Notice of Proposed Rule Making (Notice), we
propose to amend the amateur service rules to authorize
automatic control[1] of stations transmitting a digital emis-
sion on the High Frequency (HF) amateur service bands.[2]
This proceeding was initiated by two petitions for rule
making.[3]

Il. BACKGROUND

2. The propagation characteristics of the HF bands[4] allow for long distance communications. Amateur operators take advantage of these characteristics to communicate with other amateur stations, particularly with those in other countries. Establishing and maintaining a HF communications link, however, presents operating demands not encountered on the Very-High Frequency (VHF) and higher frequency bands frequencies above 30 MHz. The variables affecting communications in the HF bands are highly complex. To maintain the communications link and avoid causing interference to the communications of other amateur stations, the control operator constantly monitors the activity on the channel being used and adjusts the station's transmitting parameters as needed. Because the presence of the control operator has been imperative for proper operation in such systems, automatic control of an amateur station that is transmitting on an HF band has not been authorized.[5]

3. In 1986, however, automatic control of amateur stations transmitting digital communications[6] on the VHF and higher frequency bands was authorized.[7] In the same proceeding, the Commission indicated an interest in also authorizing automatic control of amateur stations transmitting digital communications in the HF band. In this regard, the Commission noted that a feasibility study planned by The American Radio Relay League, Inc. (ARRL) would be helpful in determining if any rule changes were necessary to prevent interference to and from other amateur service communication.[8] The ARRL's petition is the result of that study.

Ill. DISCUSSION

4. According to the ARRL, its project was carried out under Special Temporary Authority we granted to some fifty amateur stations. It states that these stations were assembled as an automated digital communication system on the 20 meter HF band based upon the packet radio protocol used generally by amateur stations on the VHF bands.[9] Based on the experience gained managing this system, the ARRL concludes that the only regulatory safeguard needed to prevent interference to other stations is to restrict those stations that engage in automatically controlled station transmissions to specific subbands within the eight HF bands where data and RTTY emission types may be transmitted. The ARRL believes that this approach will provide advance notice to other amateur operators that they may receive interference to their communications from automatically controlled stations should they attempt to operate their stations in these subbands.[10] The ARRL recommends that the subbands be those it has coordinated with other amateur radio societies in North and South

America.[11]

5. In its petition, the American Digital Radio Society (ADRS) states that it also believes that automatic control in the HF bands is workable[12] as long as proper safeguards for other users of these bands are included.[13] It agrees that communications between automatically controlled stations should be confined to the ARRL-recommended subbands.[14] The ADRS also recommends, however, that communications between a locally or remotely controlled station and an automatically controlled station should be permitted on any frequency authorized for data and RTTY emission types.[l5] It argues that the potential for interference is much less from stations operating in this configuration because the control operator of the locally or remotely controlled station can terminate the transmissions from all the stations. In its comments, the ARRL supported the ADRS petition.[16]

6. We are gratified by the cooperation and dedication of organizations within the amateur service community in determining the conditions necessary to allow automatic control of stations transmitting data and RTTY emission types on the HF amateur service bands. We concur with the petitioners that automatic control of amateur stations in the HF bands can, with the safeguards recommended. make the transmission of data and RTTY emission types practical and effective.[17] Also like the petitioners, we believe that the potential for interference to the communications of other amateur stations will be mitigated by rules based upon their recommendations. We propose, therefore, to authorize automatic control for stations transmitting data and RTTY emission types on the subbands recommended by the ARRL. We also propose to authorize communications between a locally or remotely controlled station and an automatically controlled station on any frequency where data and RTTY emission types are otherwise authorized.[18] These proposed rules are intended to facilitate the development of digital communications on the HF amateur service bands. We request comments on these proposals.

IV. CONCLUSION

7. We firmly believe in the principle that government should be responsive to user needs.[19] The rules that we are proposing are the result of a successful feasibility project planned and carried out within the amateur service community. They are responsive to the recommendations of two organizations dedicated to bringing the benefits to be derived from the transmission of digital communications on the amateur service HF bands to amateur operators in

the United States and elsewhere without causing unnecessary interference to other types of communications.

V. PROCEDURAL MATTERS

Ex Parte Rules - Non-Restricted Proceeding

8. This is a non-restricted notice and comment rule making proceeding. Ex parte presentations are permitted, except during the Sunshine Agenda period, provided they are disclosed as provided in Commission Rules. See generally 47 C.F.R. 1.1202, 1.1203, and 1.1206(a).

Regulatory Flexibility Act

9. We certify that the Regulatory Flexibility Act of 1980 does not apply to this rule making proceeding because if the proposed rule amendments are promulgated, there will not be any significant economic impact on small business entities, as defined by Section 601(3) of the Regulatory Flexibility Act. The amateur service may not be used to transmit communications for compensation, for the pecuniary benefit of the station control operator or the station control operator's employer, or for business communications on a regular basis. See 47 C.F.R. 97.113(a). The Secretary shall send a copy of this Notice of Proposed Rule Making, including the certification, to the Chief Counsel for Advocacy of the Small Business Administration in accordance with paragraph 605(b) of the Regulatory Flexibility Act, Pub. L. No. 96-354, 94 Stat. 1164, 5 U.S.C. 601-612 (1981).

Comment Dates

10. Authority for issuance of this Notice is contained in Sections 4(i), 303(b), 303(g), and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i), 303(b), (g), and (r). Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's Rules, 47 C.F.R. 1.415 and 1.419, interested parties may file comments on or before October 1, 1994, and reply comments on or before November 1, 1994. To file formally in this proceeding, you must file an original and five copies of all comments, and reply comments. To file informally, you must file an original and one copy of your comments, provided only that the Docket Number is specified in the heading. You should send comments and reply comments to: Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the FCC Reference Center (Room 239) of the Federal Communications Commission,

1919 M Street, N. W., Washington, D.C. 20554.

11. For further information, contact William T. Cross, Personal Radio Branch, Private Radio Bureau, (202) 632-4964.

FEDERAL COMMUNICATIONS COMMISSION

William F. Caton
Acting Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is proposed to be amended as follows:

1. The authority citation for Part 97 would continue to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. 154, 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. 151-155, 301-609, unless otherwise noted.

2. Section 97.109 is amended by revising paragraphs (d) and (e) to read as follows:

97.109 Station control.

(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

(e) No station may be automatically controlled while transmitting third party communications, except a station transmitting a RTTY or data emission. All messages that are retransmitted must originate at a station that is being locally or remotely controlled.

3. Subpart C of Part 97 is amended by adding new Section 97.221 to read as follows:

97.221 Automatically controlled digital station.

(a) This rule section does not apply to an auxiliary station, a beacon station, a repeater station, an earth station, a space station, or space telecommand station.

(b) A station may be automatically controlled while transmitting RTTY or data emissions on the 6 m or

shorter wavelength bands, and on the 28.120-28.189 MHz, 24.925-24.930 MHz, 21.090-21.100 MHz, 18.105-18.110 MHz, 14.0950-14.0995 MHz, 14.1005-14.112 MHz, 10.140-10.150 MHz, 7.100-7.105 MHz, or 3.620-3.635 MHz segments.

(c) A station may be automatically controlled while transmitting a RTTY or data emission on any other frequency authorized for such emission types provided that:

(1) The station is responding to interrogation by a station under local or remote control: and

(2) No transmission from the automatically controlled station occupies a bandwidth of more than 500 Hz.

FOOTNOTES

[1] Section 97.3(a) of the Commission's Rules, 47 C.F.R. 97.3(a), defines automatic control as the use of devices and procedures for control of a station when it is transmitting so that compliance with the Commission's Rules is achieved without the control operator being present at a control point. Only stations specifically designated in the rules may be automatically controlled.

[2] Section 97.3(c) of the Commission's Rules, 47 C.F.R. 97.3(c), authorizes amateur stations to use any of eighteen data and RTTY emission types when transmitting digital communications. The nine data emission types enable amateur stations to transmit telemetry, telecommand, and computer communications. The nine RTTY emission types enable amateur stations to transmit narrow-band direct-printing telegraphy communications.

[3] RM-8218 was filed by The American Radio Relay League, Inc., (ARRL). RM-8280 was filed by the American Digital Radio Society, Inc., (ADRS). The ARRL also filed comments strongly supporting RM-8280.

[4] Of the nine frequency segments allocated to the amateur service in the HF (3-30 MHz) portion of the radio spectrum, data and RTTY digital emissions may be transmitted on all but the 75 meter band (3.75-4.00 MHz.)

[5] The rules applicable to amateur service message forwarding systems were revised effective June 1, 1994, in PR Docket No. 93-85. See Report and Order, PR Docket No. 93-85. 9 FCC Rcd 1786 (1994). These revisions, however, did not authorize automatic control of stations transmitting on the HF bands. See also, Public Notice, Report No. DC-2605, June 2, 1994.

[6] Automatic control of digital communications allows amateur operators to utilize high-speed computer-based message technology for the rapid and accurate relaying of messages and data.

[7] See Report and Order, PR Docket No. 85-105, 51 Fed. Reg. 3069 (1986).

[8] See Memorandum Opinion and Order, PR Docket No. 85-105, 1 FCC Rcd 166 (1986).

[9] The protocol was the American Radio Relay League, Inc. AX.25 Amateur Packet-Radio Link-Layer Protocol, Version 2.0, October 1984.

[10] ARRL petition at 18-19.

[11] ARRL petition at 15-16.

[12] ADRS petition at 1-2. ADRS members are Commission-licensed amateur radio operators interested primarily in developing digital communications technology.

[13] ADRS petition at 6.

[14] ADRS petition at 11.

[15] ADRS petition at 10-11.

[16] Comments of the ARRL in Response to RM-8280 at 8.

[17] Other examples of designated subbands to minimize interference include subbands for repeater stations, Section 97.205(b) of the Commission's Rules, 47 C.F.R. 97.205(b), and a weak-signal subband recently established at 220.00-222.15 MHz. See Report and Order PR Docket No. 92-289, 8 FCC Rcd 8428 (1993).

[18] Stations are authorized to transmit a RTTY or data emission on frequency segments specified in Section 97.305(c) of the Commission's Rules, 47 C.F.R. 97.305(c). On the HF bands, these subbands are separate from the subbands where analog emission types are authorized.

[14] Vice President Al Gore, Report of the National Performance Review, From Red Tape to Results: Creating a Government That Works Better and Costs Less, at 6-8 (1993). The Vice President's Report stresses putting people first. Serving customers and cutting costs are two of its key principles. This Notice embraces these principles by seeking ways to allow amateur service licensees to use efficient technologies that are now available so that they can operate their stations in the manner they desire.

2083. TAPR PSK Modem install in a 1270B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-01 20:32:22 UTC
From: jchandle@netcom.com
Message-ID: <jchandleCsA3py.13p@netcom.com>
Source record: 48576

I just received my PSK modem from TAPR in the mail. I am about to start construction. Is there anyone out there with any tips and suggestions about construction and installation in a 1270B? I would also like to know if anyone has the latest sats/freqs which use PSK modems for connections.
Thanks and 73.

From: andy2@netcom.com
Message-ID: <andy2CsA5xr.8Ey@netcom.com>
Source record: 48577

I have a Mitac 3025 laptop (386sx-25) that I use for packet. It has only one serial port and I need to get another one so I can use mouse driven software with my packet system.

The computer has a "buss expansion" port on the back, and also has a provisions for an internal mode, which seems to be a 10 pin connector on the MB with ttl voltages on it.

Any suggestions on how to convert either expansion buss or modem connector to funtion as a second serial port?

Andy

2086. Help w/ PTT on Baycom-9

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-01 22:40:08 UTC
From: ebe+@pitt.edu
Message-ID: <2v2608$5gg@usenet.srv.cis.pitt.edu>
Source record: 48578

I've just received a Baycom BayMod-9, the tiny modem built into a
9 pin connector.

I have one question that hopefully someone has already solved:

Is there a way to wire the BayMod-9 to a HT without using the PTT line?

Usually this is an option and there is a approx. 3K resistor that gets
jumpered into the audio out circuit. There were no instructions included
on how to do this, nor is it obvious from the schematic.

It would seem that use of this tiny modem with a HT would be common.
Maybe it works without any special resistor?

Thanks,

Elmer Beachley ebe+@pitt.edu n3kil

2087. AX.25 for linux?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-02 04:38:00 UTC
From: marsh@crash.cts.com
Message-ID: <CsAq7D.Azu@crash.cts.com>
Source record: 48579

Greetings! I am a relatively new ham, and would like very much to be
able to run the AX.25 protocol directly on my PC, which is running Linux
instead of DOS. Are there implementations out there for use on a
Unix-like OS? Building an interface card with a different SCC is no problem.

Source record: 48581

Darren Leno (Darren.Leno@f747.n115.z1.fidonet.org) wrote:
: I'm looking for the 9600 mod for the Alinco DR-1200. Also would like to find someone who has done this mod.

: Please respond to WD0EWJ@radiohobby.chigate.com

: Thanks!

I'd suggest the following:

1) get the info from a mods database server in your area, or
2) give Alinco a call.

Alinco _used_ to provide this info freely. One of the important changes to the current DR-1200TH2 models is use of a wider (30 kHz?) filter in the receiver IF. One of the weak spots in the modification is that the PLL 'corrects' for the applied FSK modulation very aggresivly, which can cause the receiving modem difficulty when receiving a transmission from the Alinco. Note that they are not solely guilty of this, but their's seems worse than some other common radios, such as the IC-28. Also, the keyup time (TXDelay) required with the Alinco is usually pretty high - 400 - 500 mSec. This is longer than a 256-byte packet.

Hope this helps a little. 73

Thank you for posting the text of 94-59 under another subject.

My question remains, however, as to if someone knows how to find 94-59 on fcc.gov. I would like to find such items myself and spent quite some time going from directory to directory there without finding it.

Perhaps some items will just not show up there?

A company called M/X-COMM makes some chips that should be usefull.

I don't have there phone number handy, but they do have a 1-800 number that you can get from 1-800-555-1212. I think they are in North Carolina. These chips implement most of the physical layer functions and some of the link layer also.

Good Luck!

Hi Jim, I have the same combination which I put together a few years ago...
I had no trouble making it work; haven't used it much lately... Just
one comment from your note, I hope you aren't really planning to put the
PSK modem IN your 1270; it won't fit and isn't designed to. Stick it in
another small box. Enjoy!

Welcome!
You have joined the f6fbb-list@stat.com The purpose of this server is
to provide Sysops and Networkers with tricks/tips/help and new software
updates concerning the F6FBB bulletin board system. Exchange of UUENCODED
files through the server is ok, however, please limit the size of each file
cut to 500 lines. Your Sysop for the server is Daniel J. Meredith,
(n7mrp@n7mrp.az.usa.na), (dan@aznet.stat.com).

To Send Mail To Be Distributed To All Subscribers:

f6fbb-list@stat.com

And Send Normal Subject And Text.

To Remove Yourself From This Server, Please Send Electronic Mail To:

listserv@stat.com

And Include The Command:

Unsubscribe f6fbb-list

As The First Line of Your Message.

To Add Yourself To This List, Please Send Electronic Mail To:

listserv@stat.com

And Include The Command:

subscribe f6fbb-list

As The First Line of Your Message.

Requests For Help From A SYSOP - Send E-mail To:

f6fbb-list-request@stat.com

The F6FBB Server has been established to help Sysops and Networkers alike, in
providing help and information in a timely manner. Sharing of software and
other miscellaneous information via the server is quite alright.

Best Wishes!

Daniel J. Meredith

2093. Do you have an FAQ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-03 00:48:21 UTC
From: an104770@anon.penet.fi
Message-ID: <005307Z03071994@anon.penet.fi>
Source record: 48586

Hello digital radio amateurs,

Do you have an FAQ?
If so, please email it direct to me a.s.a.p. (And if you don't have one,
please say so, then let me get back to y'all with a few more questions).

I'm sorry about the anonymous posting (which you normally only see on
"alt.sex.abuse.recovery" and the like), but in my case, it is because I
am only getting Internet e-mail and my BBS does not receive your
newsgroup. As such, I can't even post to it except this roundabout way.

Also I have no way of reading replies posted to this newsgroup. I will
ask my sysop to carry you, then hope for the best. Till then, please get
in touch with me directly by emailing to mroberts%sec21@ax.apc.org.
Thanks.
(Mark Roberts)

* OLX 2.1 TD * Please reply by e-mail: sec21!mroberts@ax.apc.org. Thanks
---
To find out more about the anon service, send mail to help@anon.penet.fi.
Due to the double-blind, any mail replies to this message will be anonymized,
and an anonymous id will be allocated automatically. You have been warned.
Please report any problems, inappropriate use etc. to admin@anon.penet.fi.

2095. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-03 03:00:04 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_773204402@ve6mgs.ampr.ab.ca>
Source record: 48588
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

2100. ICOM Owners Listserver - Does this thing work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-04 01:39:56 UTC
From: KKEYSEEA@UMUC.UMD.EDU
Message-ID: <2v7p9c$sa2@nova.umd.edu>
Source record: 48595

On page 66 of the June 1994 issue of QST, there is a reference to an Internet mailing list for ICOM owners. You are supposed to send E-mail to "icom-request@hipp.etsu.edu" with "SUBSCRIBE [your e-mail address]" in the body of the message.

I have tried this several times with no results over the past month. So I have a few questions:

1) Does this Listserver work for anyone?

2) What kind of ICOM information is distributed here? [Could you E-mail me a posting as an example?]

3) Is there a trick I am missing for getting added to this listserv?

Since this is my first attempt to use a listserv, I suspect that question "3" above is the kicker.

Any help or comments would be appreciated....

Ken Keyseear WB4U
[Faithful ICOM Owner]

>Do you think it's ok ?

For what it's worth, a friend bought an MFJ 1278 last year and it didn't work. He exchanged it and this one seemed to work but had some odd problems that seemed be caused by intermittent hardware failure. He called MFJ and they were no help at all -- in fact the guy was downright rude. Could have been a fluke, I guess. He exchanged it for a third unit and it did not work either. Basically the same problem as the first -- it would power on but not talk.

At this point he returned it for a refund and bought a Kantronics KAM Plus. It worked out of the box the first time. A nice advantage is that the people at Kantronics are the nicest you could ever speak with and they really stand behind the products. Sometimes it makes me wish I had bought the Katronics KPC-3 instead of the AEA PK-88. On the other hand, the PK-88 has been working solid since I bought it.

2103. Graphic Packet 1.61

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-04 08:17:38 UTC
From: David Spoelstra <davids@truevision.com>
Message-ID: <2v8gj2$q1a@epic.truevision.com>
Source record: 48598

I just got Graphic Packet 1.61 up and running on a Baycom modem. What a great program! Unfortunately, because I don't read German, there is about 10% of the program that I can't figure out.

Is there anyone who has a translation of the manual, or who understands the program well enough to answer some questions about it?

Thanks,
-David N9PGH

Source record: 48599
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/packet/
aprs505u.zip Hams: Automatic Packet Reporting System update

APRS provides real-time display of operational traffic via UI frame broadcasts and map displays. A station with information to contribute transmits, and all stations on frequency receive and display it.

APRS505U updates APRS504U, introducing the ability to receive and plot DX cluster reporting.

aprs505u.zip contains aprs505.exe and other files updated since aprs503a was released. aprs503a.zip is also required for a complete package.

2105. 1200 BAUD bit regen circuit

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-04 12:59:19 UTC
From: tony@mpg.phys.hawaii.edu
Message-ID: <CsF2qw.2G8@news.Hawaii.Edu>
Source record: 48600

Does anyone know of any existing bit regen circuit add-ons for the TNC-1/2 clones? I've come up with a single-chip add-on to the modem-disconnect header that seems to work and still allows the TNC to talk when it needs to. But I want to see how other folks have done this.

From: rogjd@netcom.com
Message-ID: <rogjdCsFKqs.2xG@netcom.com>
Source record: 48601

Awhile ago I posted an article asking for comments about GTOR. There were very few comments!!

Once again, GTOR users, is GTOR all it's cracked up to be, or is it not? I'm a PK232 user, so have no other way to evaluate this new mode, at least for the moment!

Would sure like to get some comments. Have read that several thousand GTOR upgrades have been shipped, so I know there are users out there. OK users, what's the deal?

I've had GTOR for about 2 months ... I haven't found it an improvement
over Pactor in keyboard to keyboard contacts. But I haven't had enough
experience in trying file transfers to see if it works better on a
longer file.

2110. Help please - Packet & TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-05 07:46:13 UTC
From: ijg@oiiag.demon.co.uk
Message-ID: <773394373snz@oiiag.demon.co.uk>
Source record: 48605

First of all, I appologise if this is already a FAQ somewhere, but I couldn't see it.

I am relatively new to packet and using an MFJ1274 - TNC2 clone.
Wish I'd got into packet years ago, as I'm only just realising the level of connectivity offered. Anyway, being an Internet fan (adict?) I quite naturally picked up on the fact that some of us are using TCP/IP software with TNC's instead (as well as) the usual simple terminal packages being used by amateurs like myself.

My TNC has KISS mode available and I've downloaded and used the KA9Q NOS TCP/IP prog. I have managed, through trial & error to attach to my COM2 serial port with:
ax25 mycall G0FLB
attach asy 0x2f8 3 ax25 ax0 1024 576 9600
I have even managed to make an initial connection to a local digipeater, but once connected, I don't see any text etc..
I DO see stations using the 'ax25 heard ax0' command.

What do I do next ?
What are the benefits ?
What am I doing wrong ?
Why am I so ignorant ??

I am really keen to explore this mode, as I love experimenting. After all that's what our hobby is all about - n'est pas.

Many thanks to anyone who can get me started in this direction.

2111. New IP Address when Moving?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-05 11:23:40 UTC
From: smiller@intelsun.rus.uni-stuttgart.de
Message-ID: <2vbfrs$6gs@info2.rus.uni-stuttgart.de>
Source record: 48440

Here's a question for which I can't seem to get a straight answer:

I got a TCP/IP address allocated to me when I lived in Oregon and operated as N7APC. Now I live in Germany and operate as DL6SEU. To get on the air with TCP/IP quickly I simply made use of my old IP address. The question: -should- I get a "local" (German) IP address? In any event I want to keep my original IP address as I plan to return to the U.S. someday.

My Oregon IP address works fine of course, and shouldn't be in use by any other station on the planet (since N7APC is off the air as long as I'm here!), but one can easily tell that I'm not in the same "subnetwork" as the locals.

Many thanks,

--Shannon, DL6SEU/N7APC

>Do you think it's ok ?

I bought a 1278 used almost a year ago. Has been fine. Works well in all modes.
Have used it with a dumb terminal, the Lanlink demo, NOS and Keaterm.
Mine is an early one and doesn't have PACTOR. I've used it for packet both in
AX25 and KISS mode for TCP/IP. It IS kind of noisy though. There's a harmonic
that falls around 145mhz that you can move slightly by pulling the clock with
an internal trimmer cap. I'm upgrading it with a 2400 baud modem now.

You just need to turn on the trace function. Put a line in your
autoexec.nos
file(or just type it in from the > prompt) such as:
trace ax0 0111
That will turn on tracing for the ax0 port and monitor all incoming and out
going packets.
I had the same problem when I first started using nos, it seemed to
take
forever to learn how to just do simple things. Stick with it, all of the
work
to learn this program is worth it!! I have had many happy hours of learning
about tcp/ip and the price is right!!

2116. Questions regarding WAMPES under Sun/SunOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-05 20:54:15 UTC
From: ken@boxhill.com
Message-ID: <2vch9n$phe@boxhill.com>
Source record: 48609

Perhaps the collective out there can offer advice:

I've just installed Wampes (NOS, sorta, for UNIX, FYI) on my Sun SPARCstation
running SunOS 4.1.3, and have successfully telnetted, pinged, ftp'd to a few
other sites near me. So far, very nice!

Is there any way of more tightly integrating wampes' (aka net>) IP networking layers
into those of SunOS? Specifically, is there any way to make wampes appear
as a routable network interface under SunOS?
In this way, I could telnet (or ftp or whatever) 44.xx.xx.xx *FROM SUNOS DIRECTLY*
rather than from the "net" or "cnet" front-end. All I would have to do is
add a route such as: # route add net 44.0.0.0 mysun 1.

Similarly, could wampes understand incoming IP packets on ax0 which are addressed
to my interface (N2TIA under AX.25, as I understand it)
but whose destination IP address is not necessarily 44.anything,
and pass such packets to SunOS's network layers for routing?
In this way, I could theoretically telnet (or ftp or whatever) any Internet
address from another 44.xxx.xxx.xxx station by routing the packets to N2TIA.ampr.org
for further routing.

I noticed that wampes comes with code for many of the usual ftp clients and listeners
(such as telnet, ftp, ping, etc) which get linked into itself (net>), and thought
that this seemed like such a duplication of effort since all these services are
already running and listening under SunOS (or any UNIX) to begin with.
Wampes really should only be a network interface to UNIX, not a whole
TCP swiss army knife, no?
(I'm aware of things like NET/ROM support and plain AX.25 connection support in
wampes also, which are much appreciated. My comments apply only to the IP parts)

I'm a newbie to TCP/IP over packet, but have a respectable amount of experience with
IP in UNIX (hardwired) networks, and a modest amount of experience with plain
AX.25 packet operation.

Am I missing something here?

Thanks in advance to anyone who can offer nuggets of advice.

I'd appreciate a cc to ken@boxhill.com of any reply postings.

2117. AEAFAX II: Junk or merely mediocre?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-05 21:45:21 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.773444721@BIX.com>
Source record: 48610

Just got back from picking up a copy of AEAFAX II from Ham Radio Outlet. But even though it's not a particularly expensive package, it's not obvious to me that it's worth the money. Call me old-fashioned, but I kind of expect things to work.

I tried initially running it in the DOS box under OS/2 1.3 on my 386-based PS/2 Model 80. Installation went okay, but when I tried to run it, it aborted with only the messsage, "Serial port not fitted. Aborting." Manually specifying a com port, verifying the port is visible to the DOS box, etc., had no effect.

I then tried it on my DEC Alpha running Windows NT. It came up and did run (sort of) but not without problems. The text menu display was garbled with random garbage characters and the more I moved around on the the menu, the more garbage I got. You're supposed to be able to push F1 for help, but doing so caused it to paint and then immediately clear away the menu so fast it could not possibly be read. (It's supposed to stay up until you press another key.)

Okay, you say, this is sort of explainable since AEAFAX is really supposed to be a DOS program. So even though I really had bought it hoping to run it under OS/2 or NT -- I just *never* run DOS these days -- I decided to give it one last shot, booting my PS/2 in genuine DOS 5.0.

Didn't work. The program comes up, but when you try to display one of their sample FAXes, it paints only 1/2 the image.

I tried calling AEA's Customer Service line, ended up waiting about 10 minutes or so on hold ("Your call will be answered in the order received") and gave up.

On top of that, the whole interface/design is really crude. It's going back. I don't care what HRO wants to tell me about SW not being returnable. For me, it didn't work.

OTOH, it does raise the question: is there anything out there that does do weather FAX decently?

Regards,
Doug Hamilton KD1UJ hamilton@bix.com Ph 508-358-5715

2118. Troubleshooting Tips Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-05 23:53:50 UTC
From: jnmeade@blue.weeg.uiowa.edu
Message-ID: <2vcrqe$2m60@blue.weeg.uiowa.edu>
Source record: 48612

I'm trying to get some equipment together and am getting pretty
frustrated. I need some help in good troubleshooting techniques, or
tips on what I mgiht be overlooking.

I have a Ramsey 2m FX 146 that I've used on voice and radio OK, but not
totally trouble free. I'm running it thorugh a Ramsey kit Baycom modem
that I've never really gotten running. I'm using Baycom. I have talked
on the radio through repeaters and it seems to transmit and receive alright,
though I won't vouch for the power or purity.

I've run it on a Packkit 232 and am able to receive packets, but apparently
when I send them I don't get out right OR I dont' get an answer back from the
station called. Using the Baycom setup I get all the indications of sending
and recieving, but no messages or connect signs show up on the computer.

I'm about ready to pull my hair out. I've checked and double checked the
components, including solder joints, but am not sure of just what I need to
do to get the trouble down to one component.

I knwo this is kind of a shotgun request, but if anyone has any tips
I'd be much obliged.

Hello all-

I am interested in making some "VR" glasses except instead of using small computer screens or whatever they are, I would like to use the small screen that is looked into when you use a camcorder. Does anybody have any idea where I could obtain these? I would appreciate addresses, phone#'s, and, prices. Thanx in advance.

2123. G3RUH modem - tech description.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-06 10:27:46 UTC
From: parnell_j@kosmos.wcc.govt.nz
Message-ID: <1994Jul6.102746.1@kosmos.wcc.govt.nz>
Source record: 48611

Can anyone tell me please, whether a full technical description
of the G3RUH 9600 baud modem has been published in Wireless World
(and its successors), in QST, in Radio Communications, or any
other similar electronics journal.

If so, could I please have a reference to the article (journal
and date of publication.

Thanks in advance.

Jim.

See "9600 Baud Packet Radio Modem Design," 7th Computer Networking Conference, ARRL, 1988. G3RUH is a prolific writer, so this material may have also appeared elsewhere, for all I know.

Copies of the above article are available from ARRL for $3.00 each. Send email to tis@arrl.org requesting the copy (you'll be billed for the $3.00). Or, if the 7th CNC proceedings are still in stock (I'm not sure), you can get a copy of the whole proceedings for not much more. (Call 203-666-1541 to determine if it's in stock.)

2127. Satellite fax to HF fax converter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-06 17:06:18 UTC
From: ve8ev@gov.nt.ca
Message-ID: <1994Jul6.170618.1515@gov.nt.ca>
Source record: 48618
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

Has anyone ever built a converter to change the AM wefax from NOAA satellites to FM wefax for reception with an HF fax demodulator? Is it possible? I'd like to be able to receive satellite photos direct from the satellites but don't want to spend another $XXX to buy a satellite wefax demodulator. I've found that by carefully tuning the signal from the satellite in SSB with a very narrow bandwidth I can copy the pictures a little bit but doppler shift makes this process very difficult. It would be much easier to receive the signal in FM from the satellite and convert the audio tone's amplitude modulations to frequency modulation and feed it to my HFFAX demodulator.
Alternately, is there software available to do the same thing with a simple interface?
Thanks,
John - VE8EV

>Jim - Farmer - Iowa City, IA,

Jim...no call. Hi Jim. I have helped a few hams get there packet up and
running and it seems from the symptoms that you have described that maybe your
transmit deviation is too low.
I use commercial gear to check this out usually but you can do a quick check
with another radio or a scanner. Monitor your freq and try to connect and
listen to your signal on the air. It should sound raucous, if it sounds soft
or low that is probrably your problem.
If it sounds annoying over the air then maybe it is too high. This is a
control that can be fiddled with. A good rule of thumb is if it sounds like
all the other packets hear its ok if not... fiddle. If that doesn't seem to
be the problem it might be a software switch. Let me know how it turns out.

I have the "comprehensive technical description of G-TOR" which is about 1000 words written by Kantronics. I will scan it in and post it for all to see (and comment on). The fact is that GOLAY (the G in G-TOR) does work and was developed by JPL (I think) for use on the Voyager satellites. It is designed especially for slow speed, weak signal communnications where packet retransmission is prohibitively expensive. Kantronics simply added some compression and stuck it into a TNC. Real tests show G-TOR to have twice the thruput (of PACTOR) on a good circuit and 3-5 times on a poor circuit.

Source record: 48635

Subject: Time:2:21 PM
OFFICE MEMO Digital Conference Forums Date:7/7/94
There are six forums scheduled for the upcoming ARRL Conference on Digital Communications (in addition to the presentations and other activities):

o Digital Data Methods (voice, image, etc.)

o DSP Developments

o HF Data Methods

o TCP/IP Developments

o High Speed Data Transfer

o ARRL Committee Updates

I've taken on the task of recruiting moderators for these forums. While I have compiled my list of candidates, I'd also be interested in your recommendations or hearing from "volunteers." Bear in mind that the forum moderator does not have to prepare a formal presentation. The primary qualification is to be knowledgeable in the subject area and capable of leading the discussion.

So, if you're interested or know of someone who would be qualified, please let me know ASAP (Internet e-mail to rick_whiting@atk.com). Thanks.

By the way, the 13th annual ARRL Conference on Digital Communications will be held in the Minneapolis, MN area (U.S.A.) August 19-21, 1994. Call Cathy Thomas at 1-800-726-6715 for info or write Paul Ramey, WG0G, at 16266 Finland Ave., Rosemount, MN 55068, U.S.A.

Dave Rogers <dave@rsd.dl.nec.com> writes:

>>My idea: you post a comprehensive technical description of GTOR here.
>>We will comment it.

As for comprehensive technical description, it isn't totally published in one place - YET! The total protocol description, including flow charts for coding purposes, will be published in the upcoming digital conference papers. They have been sent to the ARRL for inclusion in these papers. Hope you'll review them.

As for comments, I could give you mine, but since I'm one of the co-developers, you probably won't want to take my word for anything, anyway! hi hi...
I have used G-TOR in over 150 qsos and have found it very robust under poor conditions. As for the one comment that it doesn't show much improvement over Pactor in keyboard, I'm not surprised - if Pactor is running full-speed on a good channel, a user would have to type 160 wpm to keep up with it. G-TOR would require a typing speed of 287 wpm to keep up. (Both of those figures ignore any compression involved.

Hope you'll give it a try - always fun to experiment with new "toys".

****
Mr. John Roberts SK

It is with sad regret that I must report Mr. John Roberts a Communications enthusiast known coast to coast passed away on July 4th. John lived in Merrimac New Hampshire and was a longtime employee of DEC working in the Tempest/EMC lab. He was a well know sight at many hamfests throughout the country. He had what could be considered one of the largest personal collections of exotic military communications equipment in the US. He was an information contributor to the internet "New England Hamfest Bulletin" that appeared on the net every month or so. I am posting this at the request of Mr. Jeff Kruth (of K-MEC West) a close personal friend of John's. Although I was only a casual acquaintance of John's I will truly miss his presence at the Baltimore area hamfests as will Jeff.

Jim Conrad

Note: Because John had many friend throughout the country I have cross posted this to several radio related groups. Apologies but I wanted the widest possible disemination so all of John's friends are made aware of his passing.

There was an article in the May, 1994 issue of QEX, the ARRL Experimenter
Exchange, giving the whole outline of G-TOR... It was written by the folks
from Kantronics and the Technical staff at ARRL... It is an excellent
article with some on-line testing results...

Kantronics expects to patent the mode, but says they will make it available
to the ham radio community... Perhaps by licensing... It would make, what
seems to me, an excellent mode, a treasure to amateur radio... I hope
greed on Kantronics part will not kill G-TOR... The success of PACTOR
is partly due to the authors' openness of development and licensing...

Does anyone know if the contents of QEX are posted anywhere on the
Internet...???

Shannon (and other fellow hams),

The whole 44.x.y.z address space is assigned to one network, the ham tcp/ip net. To work properly all stations doing 44. ip should be interconnected. Therefore you don't need another address as far as you look from the network from an exterior routing point of view.

From an interior network view - situation is somewhat different:

If all 44. stations (quite a lot) shared the same datalink layer - if we had a medium we could all be attached to - you would not need another ip address. A change in physical position would only mean another access point to the same datalink channel.

However such a nice datalink layer is not at our disposal, capacity and distance of our channels are limited and no phys/dll can support that much stations. Therefore the 44. net is subnetted.

Subnetting as it is applied now throughout the ham community does not really work. The whole idea about the subnetting is that members of the same subnet should be able to directly communicate, but here in Europe (don't know about the rest ot world) that is not always the case. Also, there is no real standard on what the subnet size (mask) is and how routing is done.

Anyway the subnet information (the difference between a US/DL ip address) could ultimately be used to build a worl-wide ip net where routing decisions are made based on that information. In your case, local ham community may or may not be heading in that direction by effectively using subnet information to route packets. If that is the case, the interior routing whould require you to get a new address to get into business.

BTW: you can have more than 1 address, so you won't lose the old one.
BTW2: anyone willing to discuss topics related to the above (external/ internal routing of 44, subnetting...) please reply. We really ought to start working on this issue. If any work is done - pointers please...

There was a circuit for an AM/FM converter in the german packet
mailboxes for reception of satellite pictures. It was used as a
frontend to the HamComm interface and JVFAX. The design is based on an
XR2206. If there is interest, i'll try to dig it up. Be warned, the
circuit description and alignment procedure is written in german.

...
: BTW2: anyone willing to discuss topics related to the above (external/
: internal routing of 44, subnetting...) please reply. We really ought to
: start working on this issue. If any work is done - pointers please...

Well, so far there isn't much discussion here, but I have some comments
on this subject...

As the amateur TCP/IP community becomes more interconnected, with
higher-bandwidth backbones and more satellite links, it's imaginable
that within some years' time the amateur network could have the
ability to route IP packets directly anywhere on the planet. At
present this is already done with Email using the W0RLI/et. al.
hierarchical addressing (dl6seu@db0rot.#bw.deu.eu) scheme. But I
could imagine being able to "ping some_US_station" from Germany, for
example. Since we wouldn't want all world-wide TCP/IP traffic being
heard all over (i.e. there's no reason for a "ping USA" from Germany
to be heard in Australia!), I'd think subnetting is the way to go,
with routers and gateways strategically placed.

And I've already read here and there that subnetting is taking place
in the amateur community. At least in-so-far as groups of 44.* IP
addresses are being assigned to different regions of the planet. (OK,
maybe it's just to help with IP address administration.)

If I were to answer my own question: "Do I need a new IP address
after moving from the USA to Germany?", I'd say this: "Short term: No,
because subnetting doesn't really appear to exist yet today. Long
term: Yes, and maybe even sooner so as to not encourage others to
"randomize" the address/region space by moving without getting a new
IP address." After all, if I move my workstation to a different
department at work, I usually get a new IP address and am placed onto
a different subnetwork.

Come on! Aren't there any other TCP/IPers on this newsgroup with some
opinions?!

Source record: 48447

Here is a short version of the "comprehensive technical description of G-TOR" which was scanned directly from a Kantronics brochure on the mode.

begin included article--->

In more than 100 tests comparing G-TOR and Pactor, G-TOR outperformed Pactor at least two to one. In poor band conditions, which would normally hinder data transfer on most modes, G-TOR remained relatively unaffected and at times transmitted data nearly four times faster than Pactor. In our tests, during which we transferred more than one million bytes error free, the average character/second rate for G-TOR was 23.7 compared to an average of 8.64 characters/second for Pactor. Based on information cited in the article, "A Practical Comparison Between Clover and Pactor Data Transfer Rates," (Van Der Westhuizen, 1994), G-TOR appears to outperform Clover as well.

G-TOR, short for Golay-TOR, was named for M.J.E. Golay's error correction code, which was used by Voyager to transmit error-free color images from Jupiter and Saturn. This coding scheme provides the basis for G-TOR. G-TOR's fast, error-free data transmission capabilities can be attributed to the unique combination of several techniques including 1) full frame data interleaving, 2) on-demand Huffman compression, 3) run-length encoding, 4) variable baud rate capability, 5) 16-bit CRC error detection with Hybrid ARQ and 6) Golay forward error correction coding. Together in G-TOR, these techniques combine to provide fast, error-free data transmission in a mode that resists interference and reduces multi-path effects.

To protect data from noise bursts during transmission, G-TOR makes use of a concept known as interleaving, similar to the approach used in the audio compact disc. Through interleaving, the bits of each data character are dispersed across the frame and then rearranged upon reception. Therefore, if a burst error occurs on the HF channel, the damage will be spread out into small pieces across the entire frame rather than mutilating large, non-recoverable sections. Usually only one or two bits of a segment will be damaged, making the entire transmission easily recoverable.

At the same time, for fast and efficient transfer, data is condensed through Huffman compression and run-length encoding. Each method may translate data into codes shorter than required by the original information.

With Huffman, certain letters are assigned a code shorter than the original 8-bit ASCII character. At times, however, Huffman compression

may produce more bits than the original message, so G-TOR is designed to use Huffman encoding "on demand" -- only when the compression actually reduces the total number of bits. Run-length encoding functions similarly, but assigns a single code to those characters which have been repeated. Through these two compression methods, the average number of bits for a message is reduced, often as much as 30 to 40%.

During transmission, G-TOR automatically operates at one of three baud rates, 300, 200, or 100, whichever is optimal given the quality of the link. The G-TOR protocol adjusts the baud rate to ensure maximum throughput regardless of band conditions. Initially, data transfer occurs at 100 baud, but if transfer proceeds smoothly, the baud rate increases to 300. In the event of persistent interference or poor band conditions, G-TOR will automatically adjust to 200 or 100 baud. When band conditions improve or interference subsides, G-TOR again operates at 300 baud.

Once data is received and rearranged (de-interleaved), G-TOR uses 16-bit CRC error detection with a Hybrid ARQ scheme to detect and correct errors in transmission. The CRC code is calculated by the receiving station, and this code must match the CRC code that is transmitted with the original data. If the CRC codes do not match, indicating that errors have occurred, the hybrid ARQ system requests transmission of the correction bits. These are then combined with the damaged data bits in an attempt to recover the original data. The Golay error correction coding can correct 3 out of 12 transferred data bits, and damaged information is most often quickly and accurately restored without requiring re-transmission.

The G-TOR mode may be used in a variety of applications including MARS and portable operation, since the G-TOR protocol permits up to 10 characters for a callsign, allowing MARS calls or special identifiers.

-------end

I guess this was the main reason to subnet, yes. However here in Belgium there (even) is subnetting at the Province level: an area of about 50 by 50 km.
Now as far as interior routing is concerned we only need to convince those flexnet/thenet sysops to add an ip router (nos/linux ...whatever) to their setup and decide what routing protocol we will use between those routers, preferably something that supports variable length subnetmasks such as ospf... With some nice hierarchical setup (note that this does not comply very well with our flat peer to peer network nowadays) and appropriate route aggregation this would scale very well. We could have a core router for every 44.x distributing to 44.x.y and vice versa. These core routers can but don't have to be connected by rf (legal?), in fact it could be routers connected through the internet being (or not being) internet gateways... In case there not internet gateways they can just pipe the ax25 traffic from one core to another over a virtual rf path built by ip.

As for external routing: we could have an internet gateway in each 44,x instead of one for 44 - ucsd.edu, however I don't know this is possible with nowadays protocols. BGP4 might give us some chances on this one.

I have an Alinco DJ-162TD HT that I picked up recently, and am trying to connect it to a Pac-comm TNC-220 TNC. I have all the documentation for the TNC, but I need the pin configuration for the HT. I think that I I have the audio in correct, but the PTT and audio out is a problem. As I understand there is a resistor ana a capacitor combination that must go between the PTT, and audio out. If anyone can help it sure would be appreciated.

I'll include my fax incase you want to send it that way.

I am also cross posting this to ham-digital.

: A Linux buddy of mine told me that you should check at
: sunsite.unc.edu for the AX.25 stuff for Linux.

The stuff on sunsite is not exactly what Thomas is looking for. It
only has an improved version of one of the utils included in the package
that he is looking for.

From my ftp_sites file:

Site Directory Contents Notes
==================== ==================== ==================== =======
sunacm.swan.ac.uk /pub/Linux/Radio Linux AX25 driver

This is the only site the author posts his work on. Someone told me why once,
but the reason escapes me now. The stuff that Alan (GW4PTS) has done is
top notch. I use it regularly.

From the directory indicated above locate the version that is applicable
to the version of the kernel you are running and grab both the kernel and
user side tgz files. The instructions are fairly straightforward.

The package make AX25 just another network port (shows up as a SLIP
connection). Its wild to be able to telnet between Linux boxes via AX25.
The utilities provide standard type of packet connections if you aren't
doing TCP/IP.

Have Fun.....73 Brian.

I picked up three camcorder viewfinders at a surplus electronics store a
few years ago. They run off 12 volts, and are lightweight. I would
suggest you scan the electronic experimenter magazines for these type
places. The ones I got were only about $20 apiece, so you should be
able to find something at a reasonable price.

Good day ladies and gentlemen. I would like to bring up a subject very important to ham radio. At least I think it is. That being the NationalTraffic System. For those of you who do not know what the national traffic system is, it is basically a newtork in which 3rd party messages can be passed for hams and non-hams alike. In fact, the system needs your help. When was the last time you checked into a voice traffic net? In fact, by reading this, you are telling me that you are interested in digital communications, and may be involved in packet. You too can help in this very valuable service. The next you can check into a full service bbs type "L", and hit enter. If you have any listings come back to you, check and see if there are any in your local calling area. If there is why not take that message and deliever it to the person so named. After you have decided to take the msg, kill it from the system, so someone else will not duplicate your efforts. You can even send a message back for them. If you ever have any questions, drop me a note, I will try and answer any questions I can. This form of traffic handling can be great practice for traffic handling in times of emergencies, such as earthquakes, hurricanes, tornadoes, fires, and, well I think you get the picture. Until next time, 73, Tuck KC6ZEC

: opinions?!

There sure are, Shannon!...

Our group here is investigating a system based upon 4 bit subnets (i.e.
14 hosts per subnet, two addresses are lost to broadcast/control) which,
at least in concept, works quite well. This number seems to provide
a good compromise between addresses lost for administrativa and a limit
to the number of users on a given channel or lan.

Yes, you need another ip number when you move outside of a lan. This is
also the case when moving between organizations; one cannot simply
unplug a system at one university and plug it back in at another without
changing addresses.

I should also note that our system here will be based somewhat upon the
dynamic assignment of IP numbers; only those hosts who are more or less
fixtures within a given lan will be hardwired to a hostname and ip address.
Other hosts will use bootp to retrieve their address from a modified
bootpd server (modified so as to assign addresses as needed within a
subnet).

Our general technique is based upon that of Bob Hoffman, whose paper
regarding dynamic IP address assignment appeared before the ARRL CNC
some years ago. Although we have departed in execution and routing
structure, the concept of dynamic allocation is clearly stated in his
paper.

All this leads to the point that most folks won't have (or need) a permanent
IP address. Although the thought of this offends some local users,
("What!!! I can't use MY ip address... well, so-and-so gave me that
address over a century ago!! Next thing, you're gonna tell me I can't
use my callsign...") the shift in complexity actually simplifies our
administration.

You're moving. Among all of your new things, you're going to get a new postal address. Why not add an IP address as well?

Please don't construe this as knocking G-TOR, but - it seems to be we are
getting awfully many different incompatible protocols these days.
Maybe it's wonderful to have so many things to choose from. But gets
harder and harder to make a QSO when we have HAL owners running Clover and
Kantronics owners running G-TOR, and some other things running PACTOR,
and just about anybody running AMTOR, and some of us still use Baudot,
and you just never hear anybody using ASCII, or Baudot at other than
45 baud. And then there's HF packet. I was just tuning around last night;
heard some Baudot, and a little AMTOR, and considerably more PACTOR, and
a couple of things that sounded like PACTOR but my machine wouldn't print
them. Maybe they were G-TOR or maybe one of the PACTOR implementations
that aren't quite compatible with the one I have. Then my radio will do
AM, FM, USB, LSB, CW, and FSK. Maybe I'll just toss all that stuff and
go back to Morse Code.

My $.02 worth...

As I see it, since the 44 network is subdivided (2nd octet) by US state or country, we've practically got subnetting. Or at least a darn good start. I know that Kansas is further divided into six regions (44.122.1 is north east), and I've heard that some are suggesting changing that to county-by-counting dividing (can you say subnet?).

IMHO, if you move far enough that your IP number doesn't have the "look and feel" of those around you, then you need to request a new IP number.

2165. PPP to Internet Over Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-08 21:57:09 UTC
From: dgreeson@newbridge.com
Message-ID: <Csn6B9.LEn@Newbridge.COM>
Source record: 48457

I was interested in the speed of packet radio (i.e. bits/second) and whether anybody was using it to hook into the Internet using a protocol like SLIP or PPP (Linux PC). A college friend of mine had a packet radio setup and it seemed like a very neat idea, but the data rate was slow. That was 10 years ago where everything was slow as compared to today's modems. Any improvements?

: haynes@cats.ucsc.edu

Well, that's one point of view. Another (mine) is that it is really
great to be living in a period of tremendous innovation and change, both
in the world and within our hobby. Where would we be if everyone decided
that RTTY was as good as we needed, and no more development is
necessary? Amtor/Pactor are wildly better than RTTY, although many old
timers bitterly resent these modes, and even now there is what amounts to
a separate RTTY sub-band above the amtor/pactor segment of the band.

GTOR, at least, is only a simple firmware upgrade. CLover and Pactor II
will require major hardware outlays, and consequently it is doubtful
whether very many of us will adopt those modes. But time will tell.

From: rogjd@netcom.com
Message-ID: <rogjdCsoHrC.lw7@netcom.com>
Source record: 48465

Well, am I the only one who is bitter about the FCC/ARRL proposal to allow one-way semi-automated xmissions in the same sub band as keyboard-to-keyboaard contacts?

It seems to me that it would have made excellent sense putting these types of qsos in the same subband as fully automated xmissions.

Nothing is more common nowadays on digital than to have a freaking Aplink station fire up right on top of a two way qso.

I know that lots of hams would rather have a qso with someone's hard disk than with a real human being; to each his/her own. But can't they do it somewhere where they will only bother other machines?

Oh well.

Message-ID: <2vn1nq$ihq@charnel.ecst.CSUChico.EDU>
Source record: 48469

Hello all! I had posted earlier about wanting some Linux Packet BBS
software. Well, I had gotten few responses, some about NOS, and some
about Wampes. I have tried both, and find both to not be too good.
the NOS package, the only one I could find, had "Chat, Users, and Quit"
Well, I think those were the commands..But anyways, it had 3. It wasn't
THAT good. The Wampes, I like as a front end maybe, but the bbs
itself that it comes with (The copy I have anyways) is not too good..Now,
of course, this is all my own opinion, if there are newer versions that
I have not found, then I am sorry, please correct me. I decided to go
ahead and code my own software, but it is currently using Wampes as
a front end. i.e., it's pretty much a SHELL that Wampes logs the
user onto. This works well. I software has File Areas, Message Areas,
MailBox for users, SysOp menu for Remote sysops, Write messages to
eachother (Users), and lots of other neat little commands, including
an easy way to let the users connect to the InterNet callsign server
via Packet (If Slip is up, or internet is connected). I am looking for some
help to develop this software even more. If you are interested in any way,
wether it be helping program, helping with Ideas, helping BetaTest it, or
anything, please contact me via Mail. I will continue to use Wampes as a
front end, until I learn, or can find someone to help me create a front end
for the BBS. If you are interested in just looking at this software,
i.e. logging onto it, please mail me also. It can be setup to answer
a port # on the Linux machine also.

Our club has just been donated 24 Microwave trancievers, and a bunch
of related equipment. We'd like to get up to speed as quickly as
possible, and would like to know if there is a FAQ in this newsgroup
that deals with:
How to get a high speed gateway from ham-packet to Internet
(Including whats legal)
How to utilize TCP/IP protocol instead of the existing Net-Rom

How to modulate a microwave tranmitter with a high data rate
stream (10 Mbits/sec)

I'd be interested in conducting "on-net" discussions of these topics
if it is appropriate, and has not already been covered in a FAQ.

I have not been following the newsgroup before, so pardon any obvious
request for discussion that is off-purpose.

Thanks

2177. How is WEFAX encoded for grey scale?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-09 21:09:44 UTC
From: hamilton@BIX.com
Message-ID: <hamilton.773788184@BIX.com>
Source record: 48471

I notice my new KAM Plus has a WEFAX mode but the claim in the docs is that each pixel is "sampled" from the audio input and taken as just black or white. Each pixel is then reported over the RS-232 port as a separate byte.

I admit I can't yet try it out to see if the docs are precisely correct as I'm still waiting for the 12v PS to arrive. But these claims in the KAM Plus docs seem at odds with the simple observation that means do exist (e.g., from other vendors) to print WEFAX charts in grey scale.

What is the actual WEFAX encoding mechanism? Is it analog or digital? If digital, how many bits/pixel? How is the framing (indication of the beginning of a new image or new raster) done?

Whatever the actual encoding on the air, does anyone happen to know if the KAM Plus is indeed only reporting one bit/pixel or is that just only what their own software package uses out of what the KAM Plus reports?

Finally, can anyone suggest some good references on WEFAX?

haynes@cats.ucsc.edu (James H. Haynes) wrote:

>Please don't construe this as knocking G-TOR, but - it seems to be we are
>getting awfully many different incompatible protocols these days.

I was thinking exactly the same thing the other day... It almost makes CW
a desirable mode of operation; it hasn't changed in almost a century...
(Note, I said "ALMOST".)

I think what HAL has just done with their CLOVER board is a good example...
They couldn't sell very many with just CLOVER, so they added RTTY, AMTOR
and PACTOR and reduced the price... I think it's still too over-priced for
the average digital ham... And if I have to buy a KAM Plus to get G-TOR,
I'm probably not going to be on G-TOR...

I have an investment in hardware and software for Pactor, in the form of
BMK-MULTY and an old HAL Modem... I'm not going to scrap that for G-TOR...
Many others have PK-232's that I'm sure they aren't going to sell for
G-TOR... If you are just getting on digital, you might spring for the
$300.00 or so required to get G-TOR, but that's not going to make it take
off...

I am going to predict that unless Kantronics opens G-TOR up to all
manufacturers and experimenters, G-TOR, too, is going to fall by the
wayside... This will be unfortunate, because it appears to be a well
designed protocol...

Pactor almost didn't make it because there were some early
incompatibilities that made it difficult to talk to anything but the
original German Pactor controller... Indeed there are still some Pactor
problems... But because so many people are involved in Pactor's evolution,
I think those will ultimately be solved... And we haven't even seen
Pactor II yet...

I think I read that the G-TOR "listen" mode is good... Pactor had problems
in this area... Nobody wants a protocol that they can't "read the mail"
with... Indeed many QSO's are made this way... You are listening to a QSO
between two people and you want to jump in and add something... This is
one of the reasons why RTTY is so popular; you can do roundtable
discussions... Nobody has to be connected to make it work... Indeed, I
have heard few AMTOR and PACTOR FEC roundtables... When someone calls CQ
in AMTOR or PACTOR it is in FEC mode, but stations answering always answer
by connecting which eliminates anyone else from the QSO...

For Keyboarding 45 baud RTTY is all anyone needs because you can't type
much faster than that... (Indeed, most hams CAN'T type, which

automatically limits the digital modes...) For large volumes of traffic, Clover has filled the bill for many of the HF BBS's... And those guys aren't about to embark on another mode at this time... They already have a big investment in CLOVER... Pactor is fine for keyboarding and small file transfers because it is error correcting and full ASCII...

AMTOR is out because most people never figured it out and those who did don't have the Upper/Lower case capabilities that digital modes need today... HF Packet radio is dead because it is a worlwide LAN at 300 cps with unheard collisions and constant retransmissions...

Have you noticed that in any of the digital contests, RTTY is the norm... It is the universal, that everyone has and so becomes the mode of choice...

It will be interesting to see what happens in a big emergency... During Hurricane Fredrick in Mobile in 1979, phone and CW were the first line communications modes... After a few days, RTTY became the mode for handling large volumes of health and welfare traffic...

During the San Francisco quake, I understand that VHF packet radio was the mainstay of health and welfare traffic... But VHF packet forwarding is limited by numerous links which are voluntarily installed and maintained, any one of which can "break the chain", and "the chain is only as strong as it's weakest link"... Today, VHF packet forwarding almost always involves HF links... I tried sending messages to WA4OSR on two 5000 mile auto trips recently operating both mobile and fixed in motels... Every time I could get on a vhf packet BBS I would send him a message... He got 30% of the messages I sent... Not a very good reliability ratio...

So as good as G-TOR may be it has an uphill climb... In what year (20xx) will G-TOR be the mainstay...???

>messages can be passed for hams and non-hams alike.

Tuck, et al...

I regularly pass messages on Packet radio... And some of the time they get through... I also try and forward local messages that wind up on the local packet radio BBS... However, IMHO, the "NTS" is a joke... I have on several occasions sent messages via the "NTS" system, formatting them in NTS format... In every case they came back as unaccepted because of length... The response I got was that the CW ops didn't like to send that much data... So I gave up on the "NTS" system...

Packet radio, if it gets it's problems straightened out, will probably replace the NTS system... I don't belive that the ARRL message traffic counts in QST each month include Packet radio traffic... I am sure that no one in Mobile Alabama sends the traffic count on our W4IAX Packet BBS to our section leader... W4IAX passes more traffic in a day than the NTS system in Alabama passes in a month... And I am pretty sure that the HF BBS ops don't report the thousands of messages a day that they forward automatically...

I suppose that what we all want these days is E-Mail... I suspect that Ham Radio had better get it's act together or the Internet here is going to be the Amateur communications mode of the 20th century... Already, a lot of technically oriented amateurs have abandoned RF for computers... I think that one of the failings of Ham Radio is in the lack of challenge to young people today that they are getting from computers... They faster we incorporate computers into ham radio the quicker there will be an influx of the technically oriented young people and the sooner ham radio becomes again a viable asset to the community...

OK, now I'm down from my soapbox...

Well I think this is mainly because of very fast link establishment more
than anything else. I operated in a contest last January for the first time
in, oh, 35 years or so; kinda felt like I was cheating to use some software
where you push one button to capture a guy's call, another to reply to his
CQ and send him a message, another to acknowledge his reply, etc. Now
back when men were men and Teletypes were mechanical and every character that
went on the air was the result of somebody typing it on the keyboard...

That's unfortunate.

You all need to remember that NTS traffic should be looked upon as similar
to a Western Union telegram...25 words or less.

]...[

>I suppose that what we all want these days is E-Mail.

We have that already.

>I suspect that Ham
>Radio had better get it's act together or the Internet here is going to be

I assume you mean the 21st century, and I sincerely doubt it.

>Already, a lot of
>technically oriented amateurs have abandoned RF for computers... I think
>that one of the failings of Ham Radio is in the lack of challenge to young
>people today that they are getting from computers.

The new technician class license has lured many computer-phobes into
ham radio. These are the folks that are creating new and exciting
software for us'ns that are not so computer literate.

>They faster we
>incorporate computers into ham radio the quicker there will be an influx of
>the technically oriented young people and the sooner ham radio becomes
>again a viable asset to the community...

You been living in a closet? Computers have been a part of ham radio for
years. I was a part of the team that created the first TTY modem for
the old Atari 800. That about 12 years ago.

>OK, now I'm down from my soapbox...

At which time I step up upon it.

Normal NTS traffic is meant as training for emergency situations.
Expecting CW ops to handle night letters is a bit extreme.

Generally NTS traffic moves well via the packet system. During the
Loma Prieta earthquake, over 10,000 pieces of NTS traffic moved in and
out of the San Francisco Bay area.

I live about three miles from the earthquake epicenter. I moved several
hundred pieces of NTS traffic via packet, and the Northern California
NTS VHF net.

It was amazing the amount of traffic received that was totally
undeliverable. I had several that were addressed only to a phone
number with only a phone number for reply. During emergencies, there is
not time to tell the sender that more information is needed.

I have mentioned before that NTS should be a part of all clubs' new
ham training. The essentials can be covered in a half hour.

A lot of people are subnetting network 44 by geography because we don't have a good solution in place for doing anything else. That doesn't mean that that kind of subnetting is a good thing - in fact, it's something you want to avoid unless you have no alternative.

The network 44 addresses aren't Dewey decimal numbers; they're station addresses. Dividing them up into subnets should only be done when there is an advantage or a requirement to do so, and NOT because the division satisfies someone's desire for order, or systematicity, or political divisions, or whatever. There should be a compelling technical reason for the existence of a subnet division.

How many of the regional subnets are connected by routers? How many are served by the SAME router? And why are those served by the same router then separate subnets?

Subnetting: do it only when there's an advantage to it.

The NTS is an obsolete system for transferring small bits of information in an inefficient way. It is primarily of interest to old-time hams. When the best method of communication was hand-sent Morse, the NTS had a reason to exist. It no longer does.

In today's environment of cellular telephones, trunked radio systems with data screens, and nearly universal deployment of FAX machines, the NTS people could best serve their community by staying out of the way of real emergency personnel doing their jobs.

Most emergency traffic is is small bits of information.

Far more NTS traffic was handled via the PBBS system than via Morse or
voice during the Loma Prieta earthquake...by an order of better than
10 to 1.

>In today's environment of cellular telephones, trunked radio systems
>with data screens, and nearly universal deployment of FAX machines,
>the NTS people could best serve their community by staying out of the

Here in Santa Clara County, officials rely on amateur radio communications,
primarily RACES and ARES. Perhaps, as you say, there are other "more
better" ways of communication, but there is a cost factor. And, it
has nothing to do with NTS.

During the earthquake, cell phone in the affected area was down, as I
recall. Those things don't work too so terribly good when they are
broken. Here in our area, any ham with a hand-held can hit a repeater.
Not true, in most areas, I admit.

Where NTS excelled during the earthquake, was the handling of Health &
Welfare traffic. For quite a period (2 or 3 days, as I recall), there
was no inbound telephone calls allowed. Those folks whose phones worked
could call out if they could get an open line. Didn't matter if it
was a cell phone or not.

I mentioned in an earlier post that I live three miles from the epicenter
of the Loma Prieta quake. We were fortunate in that our power was only
off for a few hours, and our telly line never broke. Folks a mile away
were without power for days and telly service was intermittent at best.

I was busy for a couple of days handling NTS H&W traffic.

This thread is beginning to stray from digital.misc.

>the NTS people could best serve their community by staying out of the
>way of real emergency personnel doing their jobs.

Not true, Brian! Unfortunately, many of these systems are extremely limited in ways that hurt more than the limitations of NTS. To begin with, there are only a limited number of cellular communications channels available in any given locale. While this number is very high, just remember that many, *many* people have access to cellular communications...which are going to turn into primary forms of communications when the regular phone circuits go out. I believe it was in the last large Cali quake that this limitation was truly noticed. The media saturated the area. Unfortunately, each and every member of the media had a cellfone and a deadline to make. As I recall, the cellular circuits still in service were so saturated that vital emergency traffic simply could *not* get through!

Another problem with the use of cellular communications and FAX machines is what to do when the power goes down. Unfortunately, many of these deployed devices run off of line AC with no provisions for battery backup. Hrm. You lose a large part of the power grid of a major metropolitan city and you lose a large part of your communications network.

Yet another problem with the use of trunked radio systems, etc. is that if civil defense agencies had to own, maintain, and train operators for much of the equipment amateur radio operators bring to the scene, then they'd have to have the funding for them...which would come out of the taxpayers' pockets. You'd hear screaming then!

Contrast this to Amateur Radio. We bring our own equipment to the scene. The people who volunteer for this have generally been trained by ARES or MARS or whomever to respond to such things. We generally stay at specific CCC centers to pass messages, leaving the people who have actually been trained to deal with the emergency to do what they do best...deal with it! While I agree that Joe Ham should stay the heck out of the way, ARES, MARS, and other emergency response groups provide a valuable service, just ask anybody who has worked with them.

There does need to be something of a paradigm shift about how messages are passed, though. Hammering them out in CW doesn't make much

sense when you can pass them faster using SSB or packet. Passing them all the way around the country makes little sense when you can pass them to a communications post outside the emergency zone, then get them on to faster means of communication, such as the telephone, Internet, teletype, FAX, or whatever. Rather than eliminating the NTS, it ought to be integrated more fully into the grand scheme of things.
And to whomever was complaining about getting NTS messages returned because of length, why would you send a novel via NTS anyway? I've never come across a message I've wanted to send via NTS that couldn't be expressed in a dozen words or less--usually with one of the ARRL stock messages.

2190. National Traffic System

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-10 17:51:37 UTC
From: tmill493@bssbbs.com
Message-ID: <q5D0oc1w165w@bssbbs.com>
Source record: 48485

I posted a message here a couple days back concerning the importance of the National Traffic System, and unfortunately my keyboard is sticking from time to time, and making a few mistakes. Of course I could never make any mistakes, or.....could I? So here goes my message once again, hopefully without the "typos".

Good day ladies and gentlemen. I would like to bring up a subject very important to ham radio. At least I think it is. That being the National Traffic System. For those of you who do not know what the National Traffic System is, it is basically a network in which 3rd party messages can passed for hams and non-hams alike. In fact, the system needs your help! When was the last time you checked into a voice traffic net? In fact, by reading this, you are telling me that you are interested in digital communications, and may be involved in packet. You too can help in this very valuable service. The next time you check into a "fullservice" bbs, type "LT", and hit your enter key. If there are any traffic messages they will be listed out for you. Are there any messages in your local calling area listed? If there is, why not print them out, pick up your phone and deliver the message to the person so named. After you have copied the message "kill it", so no one else will duplicate your efforts. You might offer to send a message back for them. That is great PR for ham radio!! If you ever have any questions, drop me a note. I will try and answer any questions I can. This form of traffic handling can be great practice for when we really need it. In times of emergencies, such as earthquakes, hurricanes, tornadoes, fires, and well, I think you get the picture. Until next time, 73,
Tuck, KC6ZEC

2191. Re: How is WEFAX encoded for grey scale?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-11 00:37:04 UTC
From: eac@world.std.com
Message-ID: <Csr31s.M7H@world.std.com>
Source record: 48486

In <hamilton.773788184@BIX.com> hamilton@BIX.com (hamilton on BIX) writes:

>What is the actual WEFAX encoding mechanism? Is it analog or digital?

WEFAX is analog. The HF (or FM) system uses the frequency of the signal to determine the greyscale. The Weather Satellite (or AM) system uses the amplitude of a 2400 Hz tone. Sync is at the start by using a signal that alternates between black and white. The chart takes from three to ten minutes to transmit, so frequency stability and accuracy of the sampling clock has to be good. No sync in the HF system during the chart, but I think there is a bar in the Satellite system because there is no start or end.

SSTV (at least the old 8 second B&W) is similar in that the same frequencies are used for the video information (1500 to 2300). Just consider Wefax to be a very slow Hi-Res SSTV signal without the 1200 Hz sync pulses.

Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous
ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/bbsdoor/
tncdr106.zip TNCDOOR: Run Ham Packet Radio from BBS door

TNC DOOR allows the sysop of a telephone BBS who is also a Radio Amateur
to set up his packet radio station to be accessed from the BBS as a
"door". Note that the sysop MUST be a licensed radio amateur.

Special requirements:
* at least two serial ports with a modem on one and a TNC
on the other
* a BBS program which supports DOORS via a DORINFO1.DEF
file (or a utility to convert your 'dropfile' to the
DORINFO format).
* a FOSSIL driver ('X00.SYS' by Ray Gwinn is recommended)

Changes: Numerous bug-fixes.

ShareWare. Uploaded by the author.

Shannon Miller (smiller@intelsun.rus.uni-stuttgart.de) wrote:
: Here's a question for which I can't seem to get a straight answer:

: I got a TCP/IP address allocated to me when I lived in Oregon and
: operated as N7APC. Now I live in Germany and operate as DL6SEU.
: To get on the air with TCP/IP quickly I simply made use of my old
: IP address. The question: -should- I get a "local" (German) IP
: address? In any event I want to keep my original IP address as I
: plan to return to the U.S. someday.

: My Oregon IP address works fine of course, and shouldn't be in use
: by any other station on the planet (since N7APC is off the air as
: long as I'm here!), but one can easily tell that I'm not in the
: same "subnetwork" as the locals.

Hi Shannon,

If you'd moved a couple of hundered miles north, to Western Washington, you'd definitly need a new address. In this area we are using subnetting for all routing, so addresses are issued on an lan-by-lan basis. Currently we use a 24-bit mask, so each subnet has 254 possible users. This is definitly more than any one lan can support simultaniously, but allows us to use RIP effectivly. Also makes a bit more work for yours truely as the address coordinator for this area. A bit of dBase programming has eased the process considerably tho.

The biggest problem we seem to have with the whole subnetting process is shrinking / breaking up lans that have developed hidden transmitters.

Be aware too that there are a number of gateways to internet, and if your local lan gets this kind of access, you really can't use just any old IP address, if you want to make use of any of the routers, etc. They'll send acks to your connect packets back to the entry in their routing table, and that probably won't be to your station.

Also, if you have more than one IP address associated with a particular host name, and all addresses are not active (on the air) at the same time, a domain lookup to that host name may result in a connect attempt to the inactive address, so a different host name is generally necessary for each lan you are on if you are not on all of them at the same time.

: Many thanks,

: --Shannon, DL6SEU/N7APC

Sure thing! 73

2195. Re: PPP to Internet Over Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-11 05:34:56 UTC
From: rdonnell@eskimo.com
Message-ID: <CsrGu8.GDp@eskimo.com>
Source record: 48390

David Greeson (dgreeson@newbridge.com) wrote:

: I was interested in the speed of packet radio (i.e. bits/second) and
: whether anybody was using it to hook into the Internet using a protocol
: like SLIP or PPP (Linux PC). A college friend of mine had a packet radio
: setup and it seemed like a very neat idea, but the data rate was slow.
: That was 10 years ago where everything was slow as compared to today's
: modems. Any improvements?

Most amateur packet activity (99%)is still at 1200 bauds, definitly not a speed demon. In some areas there is 9600 and 19200 baud activity, which isn't bad, and in probably 3-4 areas there are lans running at 56 k or faster.

With AX25 drivers or the amateur TCP/IP packages, PPP over the air is not necessary. Each station has an assigned IP address, either by a coordinator (I'm one) or from a block assigned to a bootp server. The latter is not common yet. At this time some areas have gateways to internet, with varying restrictions depending on abuse and operator sensitivity as to what is acceptable to allow to enter their amateur network from the internet. Unfortunatly the FCC has something to say about content of information transfered via amateur radio, and each gateway operator has to come to a decision as to how far out on a thread he wants to hang his amateur license.

With a reliable internet gateway connection, mail and ftp are possible, but tend to suffer because the slow speed and relativly high error/loss rate with radio circuits are not compatible with the expectations of the typical computer on the internet, especially retry and timeout timer adjustments. Unless you are in one of the areas where higher speed operations (greater than 9600/19200) are done, things like Mosiac are not feasable, and the hardware for the higher speeds is not yet available in a plug-and-play form, in fact, it's a looooonnng way from that yet for any speed except perhaps 1200 baud in some circumstances. Still a lot of room for improvement!

Hope that gives a small idea of where amateur packet radio is, compared to typical internet access.

: I'm trying to get some equipment together and am getting pretty
: frustrated. I need some help in good troubleshooting techniques, or
: tips on what I mgiht be overlooking.

As a former customer service rep for one of the TNC makers, the most common setup problem of a beginner I observed was that the transmit audio level from the modem to the radio was set incorrectly. The best way to set this is with a deviation meter. Make sure the radio's deviation limiter is set to limit deviation at 5 kHz, then adjust the output level of the modem to drive the radio to 2.5-3.5 kHz of deviation. The high tone (2200 Hz) should be set to 3.5 kHz, and with the normal pre-emphasis in the radio, this will usually result in the low tone (1200 Hz) deviating the radio about 2.5 kHz. When in doubt, use a lower level rather than a higher level - most modems have trouble with distorted audio.

If you have to set the TX level without a deviation meter, monitor your signal with another receiver (scanner, HT, or whatever) and if possible use a scope to look at the receiver's audio. Note how loud other stations on the channel are, and set yours a little lower - as I said, the most common setup error is too much TX audio.

Hope that helps.

: David, What is a 44 network? Where do I get some info? Thanks.
: William Vaughn vaughnwt@olympus.net "Just plain Bill."

The '44 network' refers to the IP address space that is allocated to the 'ampr.org' domain, that one used by amateurs. In other words, internet protocol addresses of the form '44.x.x.x' where x is a number from 0 to 255, with certain reservations.

There are national and regional IP address coordinators for the 44 network.

If you're a ham and interested in using TCP/IP networking over amateur radio, let me know where you are located, and I'll try to locate the coordinator for your area and pass the info back to you.

>the beginning of a new image or new raster) done?

HF WEFAX is encoded analog in FM. Therefore to transmit the intermediate gray scale values, the audio frequency shift is less than the full white-to-black shift. What the decoder may be doing is sampling zero crossings--from which it can determine the period between the crossings, and hence the frequency of the received tone. That's how the AEA FAX and JVFAX seem to perform their duties.

Doug,

All HF WEFAX is analog. The image is intensity (grayscale) encode with black being about 1400 Hz and white about 2150 Hz. Most simple minded FAX decoders (TNCs) use one-bit sampling (monochrome); i.e. a pixel is either black or white. Sophisticated decoders use eight-bit sampling and further convolve the image using nearest neighbor convolution, dithering or multi-line resampling or all of the above. I don't know of any hardware only solutions which do all of this. The M-8000 and Hoka Code 3 are the best hardware solutions but the cost $$$$. I have used the M-8000 but not the Hoka Code 3. The best thing about the M-8000 is all of the digital comm modes it supports. The Hoka is only just now available in the US from the SCANcat folks in Shreveport, LA. It is firmware programable for any of the modes you are interested in. You just buy the add on module.

Personally I wouldn't buy any expensive hardware solution today. All of the interesting stuff on HF is being phased out and going to satellite. The Navy is phasing out all of their HF FAX stuff next year. There is very little press fax left. Almost all of the other digital stuff on HF is encrypted. The best solution available right now is the SSC software I told you about last week.

Check out the Klingenfuss Guide to Facsimilie for an authoritative reference on all radio FAX.

>necessary?

For some things, it *is* as good as we need, though. For rag-chews, RTTY
really works well. It works with as little signal as Pactor, and I
prefer missing a few letters to having to recover a failed Pactor link.

Pactor gives you lower-case letters whoopee...

Pactor lets you send pictures... ...okay, so that's interesting, but
most people don't do it.

Pactor doesn't give you full duplex...

It doesn't help you type any faster, so you don't really use the
200 baud speed.

So, for me at least, getting on Pactor represents and interesting
effort, but nothing that RTTY doesn't.

AMTOR seems to have some clear advantages, without being as persnickity
as Pactor sometimes gets.

> Amtor/Pactor are wildly better than RTTY, although many old
>timers bitterly resent these modes, and even now there is what amounts to

I would submit that much of what gives the impression of 'wildly better'
is the 'wild improvement' in decoding brought by the multi-mode TNC; and
this is not an improvement in signal processing, but rather in operational
convenience... ...specialiged TU's are still the best. However, as someone
who came to all the digial modes simultaneously, I find little to choose
between them, except what mode the station I want to work is running :-)

>GTOR, at least, is only a simple firmware upgrade. CLover and Pactor II
>will require major hardware outlays, and consequently it is doubtful
>whether very many of us will adopt those modes. But time will tell.

I believe that the mode that offers:

1. Higher speed
2. Robust connection
3. Duplex operation

4. Multiple connects or 'background' operations

...will be the 'real' successor to RTTY, and become the universal mode.

I'm not convinced that that mode exists as of yet.

Wrong. RTTY does not BEGIN to compare to either amtor or pactor when it
comes to weak signal thruput. Rtty does not work well. In fact, it
usually doesn't work at all.

: Pactor gives you lower-case letters whoopee...

Wrong. Simply wrong. The reason amtor/pactor work better than rtty is
that they are better modes than RTTY. RTTY is a primitive, first attempt
at an over-the-air teletype method. The fact that hams are still using
it at all is merely a commentary on the conservatism present in our hobby.

: >GTOR, at least, is only a simple firmware upgrade. CLover and Pactor II

Amtor/Pactor are already the successors to RTTY, which is a dying mode in less use every day. Both already offer higher speed and robust connection. As far as 3/4 go, yes, perhaps more development is called for, which is what I've been saying. :-)

: ...will be the 'real' successor to RTTY, and become the universal mode.

: I'm not convinced that that mode exists as of yet.

I would argue that there may never be a universal mode. Protocols tend to be compromises, and one mode may do one task better at the expense of a second task.

On the other hand, some modes, like RTTY, have been pretty much surpassed in detail.

Human nature being what it is, I suspect hams will just 'return fire' to
an automatic, interfering packet relay station. What a mess that's going
to be...

Same in Tennessee, we have 3 divisions for users and 1 division for a
statewide backbone. Each division of the state is then broken down
even further, giving us a netmask of 255.255.255.192 meaning that there
are 62 hosts per network available.
And as someone had mentioned a standard netmask, I really see no need
for that, after all there is no standard netmask on the Internet is there?
All you need is a (at least one) route to the general area. Let the
protocols take care of the routing, why are we trying to let people get
involved in the routing anyway.

Gee, my PK232 copies passing well an RTTY signal which has faded to
the degree that I can't hear it well enough to re-tune it. Although
I can maintain a PACTOR connect in the same circumstance, I *will*
have to go through the lost connection hoop within a couple of
minutes under such circumstances. That's worse than RTTY, IMHO.
AMTOR *does* work better (I never said it didn't), but is really
RTTY by another name, given the feature set (all caps, etc.).

Furthermore, most 'rag chews' are not weak signal.

>: Pactor gives you lower-case letters whoopee...

>

That's the culture here. In keyboard-to-keyboard it's almost nicer
not to worry about caps (though the punctuation rules are a mite
flaky).

So it isn't a big deal, hey.

No, the 'primitive first attempts,' unlike RTTY, weren't the mainstay
of wireless written data transfer for half a century.

> The fact that hams are still using
>it at all is merely a commentary on the conservatism present in our hobby.

Pfft. It isn't a commentary on anything. Other than the reality that,
for many applications, RTTY still works pretty well. And that the
cost:benefit ratio of the mode hasn't yet rendered it obsolete. Yes,
lids and appliance operators sometimes have problems making it work
right; they quite naturally will claim that it is non-functional and
turn to modes which limp along in spite of lousy operators. But it
has always been so with less user-friendly modes.

Robust connection? Pactor? Har-de-har-har.

And I would venture that a number of people bought a TNC to get on Pactor, which was billed as god's gift, then 'discovered' AMTOR as a mode which actually works reliably out of their frustration with PACTOR's quirks.

>: ...will be the 'real' successor to RTTY, and become the universal mode.

I would argue that a protocol will arise which is flexible as to details like packet-length, etc, and which contains the foundation for a number of utilities underlying it, so that keyboard-to-keyboard chat uses one function, file transfer another, etc. So far, ham radio has implemented about one version of each 'layer,' on each protocol set. Not surprising, since we're still trying to get generic details of the physical and link layers worked out.

>On the other hand, some modes, like RTTY, have been pretty much surpassed
>in detail.

Careful, Rog, by extension your arguments *ALL* HF communications outside of broadcasting are probably outmoded.

Greg

2206. NTS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-11 15:37:04 UTC
From: rush@sparkyfs.erg.sri.com
Message-ID: <9407111537.AA25181@dns>
Source record: 48399

NTS does two things. (1) It provides training should the "big one" hit (insert your favorite (un)natural disaster). (2) It provides a service to real people, be they aunts and uncles sending birthday greetings to little Eugene or requests for medical supplies in an emergency.

>The NTS is an obsolete system for transferring small bits of information
>in an inefficient way.

I'll agree that it's old and not efficient as it could be. But it does pass a lot of messages. Some of them are important messages.

>In today's environment of cellular telephones, trunked radio systems
>with data screens, and nearly universal deployment of FAX machines,
>the NTS people could best serve their community by staying out of the
>way of real emergency personnel doing their jobs.

No argument that the advancement of technology has changed things from the way they were 25 years ago (the technology has advanced to the point of becoming a boring but useful appliance that anybody can use with ease).

But that's no reason for NTS to sit on its hands. Recent disasters have shown that hams do provide a valuable communications service.
Instead of poo-poo-ing what we have now, let's work on improving it.

>isn't bad, and in probably 3-4 areas there are lans running at 56 k or
>faster.

Since this is the case (*sigh*)... and since I am utterly clueless as far as UHF or above radio and modulation techniques go :-), here's my 'question du jour': how difficult/expensive would it be to design and build an all-in-one radio+modem+interface to provide reasonably high-speed packet communication in the high UHF band? Because most transcievers probably aren't designed to handle the bandwidth needed for the raw data (a bit more than a 20-20k Hz, I would assume :) it probably makes the most sense to build a dedicated radio into the unit instead of using an external one. (?)

Perhaps it's a very difficult problem (as if I know...), but I just keep feeling like it *should* be possible. Ok, so you want motivation? How about the announcement that "by the fourth quarter... Motorola will offer its first PCMCIA-based 2.4 GHz spread-spectrum wireless LAN, operating at 1 Mbit/s, based on the FCC's unlicensed bands." (EE Times, 7/11/94, p. 63) This sounds like a really interesting product, but how possible would it to make a kit along these lines, in a much larger form factor, at perhaps an order of magnitude slower? Could DSP techniques be used to simplify the problem?

From: jackson@longlast.cs.nyu.edu
Message-ID: <2vs2vg$rig@thecourier.cims.nyu.edu>
Source record: 48407

Hiya locals (hopefully),

I picked up a TNC recently to see if I want to join the area packeteers. Could someone email me a list of PBBS's in the area and the freqs they operate on? I am monitoring the airwaves to see what kind of activity goes by. I have been specifically looking for keps, newslines, and ARRL Bulletins to no avail.

Just by scanning, I have picked up three freqs with about five to ten ider's operating on them. The busier the PBBS, the more I will get to "peek over the shoulder", and make my evaluation.

Many thanks in advance.

A new release of the NPFPMS code (version 2.21e) has been uploaded to the following ftp sites and available via anonymous ftp from:-

oak.oakland.edu as /pub/hamradio/NPF221E.EXE
ftp.demon.co.uk (158.152.1.69) as /pub/ham/NPF221E.EXE
ftp.funet.fi (128.214.248.6) as /pub/ham/packet/misc/NPF221E.EXE

Files available are

NPF221E.EXE 367909 bytes NPFPMS 2.21e in LHARC format
NPF221E.DOC 3245 bytes Information file

The changes since the last Internet release (2.20a) in May '94 are some bug fixes and new enhancements including:-

+ A 'pop up' window is now used for displaying the progress of file transfers and compressed forwarding, and for some editor functions.

+ Parts of the binary compression system have been re-written to improve efficiency, and to remove the need for some temporary files.

+ Option to save messages deleted from the PMS message base, to a specified directory, which may now be on a different drive.

+ NNA Bulk forwarding.

Uploaded with permission, and on behalf of, the author of NPFPMS, Ted Harrison G8NPF [Email: tedharrison@cix.compulink.co.uk]

My turn on the soapbox. I have two concerns about this discussion, FWIW.
Note I DO NOT "do" packet, so my perspective is purely as a "victim" 8{)>.

First, I have handled traffic for a while, although I am not as active as
I once was. The problem I have with the packet deal is that too much
traffic DEAD ENDS there. I have often handled traffic in my local net
that was DAYS old, or worse, DAYS OLD and REDUNDANT because ops either
a) didn't check the boards or b) didn't kill a piece when they took it.

The key to effective traffic handling is PEOPLE, whether they're CW, SSB,
FM, or packet ops. My experience with packet traffic is generally bad.
(I understand this could be a local problem.) IMHO, too many packeteers
rely on the machines, forgetting that you have to actually HANDLE the
traffic (with real hands!), particularly in emergency situations. If YOU
are not aware and awake at the key/mike/keyboard, your station is useless
in an emergency. Most packet machines I know of don't know from message types.

IMO, it's the TRAINED OPERATOR that ultimately makes the difference when
the poo-poo contacts the oscillating ventilation device, regardless
of the technology in use. IF the systems are up, and IF the routing is there,
and IF the operator pays attention, everything works fine on packet.
Educate me: How many PBBSes have alternate routing functions? What does
K2ABC-99 do with traffic it can't deliver? Does it forward endlessly,
or "cancel mail"? How do you KNOW the message isn't getting through? How
long does THAT take? And where ya' gonna go when the machines get around
to telling you that your packet traffic bogged at the border?
(Hint: it's initials are NTS).

When packet works, it works great, BUT SO DOES THE PHONE. And what happens
when that breaks? OEM yells, "Hey, Rube!", and the hams come a-runnin'.
So in you rush with a handheld and a laptop and you're going to convince them
that YOUR hom'ade hi-tech, hi-speed digital system is better than THEIR
millions-of-the-taxpayer's-dollars hi-tech, hi-speed digital system which
just took a flying leap into the toilet? Well, I hope you got all your
digipeaters and packet nodes up and purrin', Spunky, or you're not even
getting called next time; trust me, I been there.

We have a problem in an OEM structure that has come to rely on technology
like cell and fax. The gas explosion in Edison last March proved how
useless the phones were in a pinch; emergency traffic stalled because of
press, and folks trying to call family. This was small compared to something
like the Loma Prieta quake, the cell sites WERE STILL UP, and the regular
system still choked.

Invariably it is the OPERATOR, not the technology, that gains the confidence
of the good EM honcho, because the OPERATOR knows what route to use when

the regular systems swamp or otherwise become useless. If the right route is packet, fine. But don't shortchange NTS. To my mind, ARL standard grams on CW can be MORE effective than packet because packet suffers from many of the faults of the commercial systems it tries to replace in an emergency - it's just too complex. Sometimes down & dirty is what gets the job done.
--.- ... .-.. ..--..

I understand that packet is probably not totally automated AT THE SITE OF THE DISASTER. But this only proves my point; it's the operator, The Operator, THE OPERATOR that makes the difference. Regular NTS ops know the nets are generally where they're supposed to be when they're supposed to be. And it's the ops that make it happen along this "obsolete" relay route. I agree that packet has never been properly integrated into NTS. And, yes NTS needs work, particularly at the local level, to draw in new people. But again and again, what make NTS work is dedicated operators, not technology.

My second point has to do with training the ops. That discussion will appear in r.r.a.policy, because it has to do with RACES vs ARES et al., and I've cluttered this group enough already.

Thanks for the use of the soapbox. I now return the bandwidth to casual use.

> the NTS people could best serve their community by staying out of the
> way of real emergency personnel doing their jobs.
> - Brian

Brian my friend, I believe you are way off base when you feel NTS is obsolete.You could not be further from the truth.First, I am not an oldtimer. I have been into ham radio now since August of 91. During that time, have been actively involved into the Public Service. I felt I needed to do even more for the hobby, so I tried a voice traffic net, not cw!! I was hooked!! Then I got involved into the packet mode, and then decided to get thoroughly involved with message handling.
As for your comment about NTS people staying out of the way so REAL emergency personnel could do their jobs, I don't know from where you came, or what bad experience you have had with NTS, but since you live here in the San Diego, and are experienced with packet radio, I am sure you see many NTS messages go though your bbs system everyday, or at least passed thru the different nodes. Please feelfree to give me a call at 475-1540 if you ever have any questions regarding the NTS system, and maybe I can clear up any misconceptions you might have.

I suggest getting a new, local IP address if you are going to be there for the long term. At the moment we really don't have so much need for organized addressing due to the lack of IPers in most areas. This is like to change in the near future and at that time maintaining a localized address will be critical to maintaining clean routes. I and the local TheNet nodes don't have to keep two dozen entries in the routing tables because we know all 44.106.56.xx addresses go this way and 44.106.3.xx addresses go that way. Simplification sure helps keep the routing tables in check. :-)

You moving into the area with a non-local address could have significant impact on your ability to be heard. Routers in your immediate area may add a route specifically for you, but what about routers down the line? They don't recognize the odd address so you won't be able to get traffic beyond a certain point. The routers in my area, for example, easily handle new addresses of the form 44.106.56.xx and 44.106.3.xx. If you move in with an address outside this range, you won't be recognized and nobody will be able to get to you.

: Andy N3LCW

Well, I hope/think you are wrong; most hams don't deliberately jam (I hope). But the problem with semi-automatic qsoing is that, due to the nature of skip, it is very possible for the automated end of the "QSO" to interfere with a station that the "human" end could not hear. This would/might be avoided with humans at both ends listening, as in a true qso.

This is why I oppose semi-automated operation in the same sub-band as keyboard-to-keyboard qsos.

It has happened to me a number of times on the 20 meter amtor/pactor subband. QRM seems to be clearly disproportionately present when one end of the interfering link is automated, apparently for the above reason.

I just don't understand why the semi-automated crowd was so adament about being allowed to operate in the keyboard/keyboard segment as opposed to the automated segment of the band.

Subject: Poll bit question (pse help)

I am trying to track down a protocol problem between one of my users and parts of the network. Below are two excerpts from my monitor screen.

The first shows the problem. ANG is a local TheNet (x1j2) node and the station I'm trying to help is WD0BQM. His complaint was that when he used my new user port, that must be accessed via another node, throughput was much slower, instead of being faster. After watching it for awhile, I could see why. Every time he received a data frame from the node, his tnc would not ack it. Instead, it printed the data on his screen and waited for the next supervisory poll from the node before acknowledging it.

In the following example, he has issued a B command to the node. The node responds with the "Goodbye" data frame without the poll bit being set (the ^ indicates poll bit not set). He receives and prints the "Goodbye" on his screen, but he doesn't ack it. Then, ANG polls him to see where he is (RR1+) and is sent the proper ack (RR2-). At that point, ANG sends him the disconnect frame and he acks it. This one at a time procedure happens all the way through the data.

[1] fm ANG to WD0BQM ctl I11^ pid F0
ANG:AG0N-1} Goodbye.
[1] fm ANG to WD0BQM ctl RR1+
[1] fm WD0BQM to ANG ctl RR2-
[1] fm ANG to WD0BQM ctl DISC+
[1] fm WD0BQM to ANG ctl UA-

Contrast the above with the following excerpt on the same frequency.

The same station has connected to the BBS alias direct. He is sent the 0 data frame with poll bit set. He acks it immediately. Each time he sends a command, he is sent the data with the poll bit set and things run several times faster than above.

[1] fm WNBBS to WD0BQM ctl I00+ pid F0
[FBB-5.15-ABFHMR$]
Hello, Jim.
364 messages

[1] fm WNBBS to WD0BQM ctl I11+ pid F0

You are now in "Server-mode". Type F <return> for BBS-mode again.

(2) SERVER-MENU (C,D,N,Q,T,F,B,?) >
[1] fm WD0BQM to WNBBS ctl RR2-

The obvious questions are...

Why are the nodes not setting the poll bit, thereby causing all these
delays for the user? Should they be? What can be done about it? Is
there ANYTHING that I'm doing in the setup of X1j that is incorrect and
causing the problem. I've been running nodes for a long time have not
noticed this before. Maybe I was asleep all this time?

As I was typing the above questions, I wondered why I hadn't noticed this
problem myself. I tried connecting (level 2) to the local node and
sending data frames to it and watching the response. My data frames had
the poll bit set, the responses from the node did not, as above. However,
my tnc acked the non-poll bit data frames from the node, where WD0BQM's
tnc did not.

Data:
WD0BQM is using a Tiny-2 with factory firmware
WNBBS is a DRSI card with BPQ4.07a running
ANG:AG0N-1 is X1Jr2, as are the other two nodes tested

Any help someone might be able to provide would be appreciated. I have
not tested with other stations to see exactly how they handle this
situation. I will be doing so in the next few days.

Please send email replies to the address below. Posting to the net is
also fine, but use the address below if you respond direct.

Thank you and 73,
Gary

I hope I'm wrong too, but my impressions about unattended digital HF are quite negative (surprisingly so, especially since I'm a data-comm engineer). I've seen many digital stations (automated and otherwise) come up right on top of a CW QSO on 40M (about 7040-7050) and wreak the whole QSO. I've listened to obviously ticked off hams start sending a rapid series of dits on top of the digital station (I assume to jam ?) I've connected to these interfering op's and they apparently had no regard for what they were doing.

We'll see what happens, I'm not going to be overly optimistic, unless they 'coordinate' some sort of band plan...

This is the first time in my recollection that the FCC in concert with the ARRL is knowingly and willfully going to issue a rulemaking that is guaranteed to create interference, "return fire", and mayhem on the HF frequencies. Even some of the architects of the plan that I have talked to state that they accept that for a period there will be chaos - sort of a darwinian approach, ie. the resulting system will be better for it in the end. Changing times? You bet! IMO it speaks of the FCC's latter day decline in discipline and principles, and sellout to big money interests. One interesting aspect of this debacle will be the reaction of other "over the border" governments to this in the IARU or ITU. Or will they be as shallow and commercial as ours?

Notice that there is no incentive to create "smart systems" that can find one another and communicate while dodging interference and other QSO's in the HF bands. This is easily doable, but apparently stands to cut into the big profit margins that the mfg'rs are poised to make.

>don't have the Upper/Lower case capabilities that digital modes need
>today...

This is no longer true. All the APLINK (Amtor Packet Link) mailboxes
around the world use an extended amtor code with upper/lower case and
extended punctuation. It has all printable us-ascii characters and is
compatible to older equipment. This feature is supported for example
by PK-232s and HamComm 3.0.

I also don't see what's so difficult to get amtor going. It requires a
transceiver with fast rx/tx switching, but that is not a problem with
newer models. I have used an FT-747, TS-440 and TS-950 without any trouble.

Those who don't know what they are doing will have problems with any mode :-)

2227. Multi Mode Controller

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-12 17:36:49 UTC
From: bgrattan@s850.mwc.edu
Message-ID: <2vukbhINN2gh@s850.mwc.edu>
Source record: 48426

I would like some recommendations on a good multi mode controller. I plan to do mostly listening/watching and some transmitting, probably on packet. I'm interested in all bands with as many modes as possible with room for upgrades. The AEA PK-900 looks interesting, is it worth the investment?

Many thanks for suggestions. You can e-mail me personally as I'm not sure this is specific enough for the group.

Bob - N4MRV

2229. Digital Mode Bandwidth

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-12 18:46:29 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9407121741.AA24363@ATK.COM>
Source record: 48423

Subject: Time:12:36 PM
OFFICE MEMO Digital Mode Bandwidth Date:7/12/94
I'm looking for measured bandwidth data for the HF digital modes as defined by 97.3(a)(8). Anybody have the measured data know of a source? The modes of interest are:

1. "RTTY" 170 Hz FSK; 45 bd
2. AMTOR 170 Hz FSK; 100 bd
3. AX.25 packet 200Hz FS; 300 bd
4. PACTOR 200 Hz FSK; 100 and 200 bd
5. G-TOR 170 Hz FSK; 100, 200, and 300 bd
6. CLOVER-II

FCC 97.3(a)(8), you will recall, specifies the bandwidth outside of which the mean transmitted power is 26 dB below the mean in-band power, i.e., the out of band power is 0.25%.

Thanks es 73 de Rick W0TN <rick_whiting@atk.com>

2230. NOS-compliant SMTP utility

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-12 19:44:43 UTC
From: jcaradim@gr.oracle.COM
Message-ID: <9407121944.AA06745@GRSEQ1.gr.oracle.com>
Source record: 48417

Hello Folks,

This message was also posted in the nos-bbs@hydra.carleton.ca list, but unforun
ately it didn't raise any significant responce (I thank Greg ke4dpx for his
sole answer).

Let's summarize : There is VIEW, a very nice DOS-based mailer for NOS. Very
useful to compose and read your mail messages. However, to have your mail send
out, you need to enter NOS and do an SMTP KICK. Now, if you can have an
external (to NOS) tcp/ip stack (like with PC/TCP), you could use an external
(to NOS) SMTP utility to have the messages (stored in the \nos\spool\mqueue
directory) kicked out over the network.

I tried using the SMTP of PC/TCP, but it is a pain in the butt, as it expects
the various parameters like the recipient etc) from the command line. It also
creates some wierd addresses, like :

%xxxxx.yyyy.zzzz@aaa.bb.ccc

which require additional entries in the recipients rewrite file, in order to
be handdled correctly. Oh, it also screws up the mailboxes of the recipient
sometimes, for no apparent reason.

THE FIRST QUESTION IS :

Has anybody written an SMTP utility (as simple to use as the NOS
SMTP KICK command, that will understand the NOS directory structu
re, the various To:, From: and Reply To: fields, and that will send out
the outgoing messages, to the appropriate addresses, over the network?

THE SECOND QUESTION IS :

Has anybody managed to use a commercial SMTP utility (such as PC/TCP'
s) with the directory structure of NOS? If yes, which is the program,
how have you set up your SMTP parameters?

Come on folks, I have done no network programming, so creating such a program
is not an easy task for me, but I know that there are a lot of genious out
there who play the tcp/ip protocol in the fingers of their left hand. Someone
should have faced a similar problem. Don't be shy, let me hear about it!

Many thanks in advance.

Best 73 de John (SV1CEC)

Actually, it is you who are wrong. I take it you do not operate much
RTTY. I operate RTTY, Amtor, Pactor, and will soon play with Gtor. I
still use RTTY quite a bit.

[much stuff deleted to save bandwidth]

>

>it at all is merely a commentary on the conservatism present in our hobby.

I assume you make the same comment about CW, then.

RTTY is an enjoyable mode, just as CW is. The fact that a few letters are
lost here and there is not a big problem. About the same as loosing a
few CW characters to a static crash.

Since all of the ARQ modes are so superior, why do they not support more
than two users? I have frequently been in round table discussions with 5 or
6 people on RTTY, sometimes growing to 10 or more. With RTTY, everyone can
participate.

RTTY is also the mode of choice for digital mode contesting. This is
because it takes too much time and trouble to have to connect and disconnect
on each contact with the ARQ modes.

There are two different uses being discussed here, one is the keyboard
to keboard conversational user base, the other is the computer to
computer data transfer base. Many folks will do some of both, but
few folks really are going to heavily use data transfers over HF.
If you want speed, then the microwaves are the place to go...

You can ftp the current "master" list, both forward and reverse translation
versions, from ucsd.edu. It's available both in text format and as a zip
archive.

I haven't seen a FAQ, but there is plenty of good documentation. Several
fine beginner's guides are also available at ucsd.edu, and I heartily
recommend Ian Wade's book NOSIntro.

Here in the States it's pretty rare to have a keyboard-to-keyboard amtor
qso in upper/lower case, although I know that the PK232, at least, does
support it.

Not sure why. I know at one point there was a question as to whether or
not that is legal in the USA.

Perhaps the real answer is that most of those who would have gotten up to
speed on upper/lower case amtor simply switched to Pactor?

: - Brian

Geez, Brian, I can't believe you of all people are saying this--
there already is an advantage to it.
If we start suggesting now that people use their old ip
address when they move into a new area, we're going to end up with
a real mess. It's already hard enough to teach some hams what
ip numbering and a netmask is all about, nevermind if we start
throwing together a mess of different subnets in the same area.

When I put a Internet/AMPR gateway on the air a couple years
ago in Kansas, it was partly the consistancy of the subnetting
which allowed it to work. Can you image if I had to advertise
routes for the 44.122.1.0 subnet and also these three or four ip addresses
of guys who moved into the area but kept their old ip number?

You don't want to go strictly by geographic region, but you should
let the local coordinaters then subdivide according to their
specific situation. Just keep it in some kind of order so that
as things develop we don't have to worry about all kinds of
renegade addresses.

X1 (and other TheNet versions) don't set the poll bit on the final I-frame of a set. I know that BPQ does, which might be why the second example worked better. What is missing from the above is the RESPTIME setting (or whatever it is called in his particular variant) which should cause a spontaneous ack to the I-frame ater a preset time has elapsed. Either RESPTIME is set longer than the FRACK of the node or it isn't properly implemented.

It will still be slower than working something which manages to set the poll bit on the last I-frame of a set though.

This is an interesting comment, Greg... A little while after I got on Pactor, WA2FMY, Pete, put on his AMTOR/PACTOR Worldwide mailbox... Most people who have spent much time on HF digital have checked into it... Since it operates on both AMTOR and PACTOR with the same transmitters and receivers, it is an interesting comparison of AMTOR vs PACTOR... I haven't checked into it in a while because of being stuck here on the Internet, Hi Hi...

But several months back, when I checked in under marginal conditions, AMTOR would always work better than PACTOR... Since I had dumped my old RTTY/AMTOR setup for the new BMK-MULTY with PACTOR, I was a little perturbed that the PACTOR didn't work nearly as well in bad conditions... I worked long and hard to try and get PACTOR up to AMTOR levels and never really did... Since AMTOR is really well defined and PACTOR wasn't back then, I attributed this to software and the "newness" of PACTOR...

I have had several upgrades of BMK-MULTY since then but I have not retested the AMTOR/PACTOR comparison... But I suspect that your comment is correct... It would be interesting to survey the group and see what the experience has been...

I have been well satisfied with the BMK-MULTY software and the low charge upgrade policy... And I like using the plain vanilla modem... The upgrade comes on a diskette and no ROM's to purchase...

Given the number of PK-232's and KAM's that have been sold, the HF bands should be teaming with HF digital signals... However sometimes it is difficult to get a qso going... 'Course, you do have to be able to type to make those digital thingy's to work...

Good point, Mitch...

So what are you doing with that VibroPlex collection...???

I really think that ham radio has got to be making major strides RIGHT NOW if it is going to survive... As the telephone system goes to satelite and fiber optics for reliability, and as access to high speed data links becomes more available and as computer hardware becomes more generic, ham radio is going to be surpassed in communications just like the Automobile bypassed the horse and buggy... (OK, I'm open for flames here...) Horse and buggies are today just for pleasure and nostalgia, and that's maybe where ham radio is headed...

Already a program is available here on the Internet to allow you to have voice communications over the Internet... All you need is a SoundBlaster card... So, why not voice, Internet Relay Chat... Why not voice roundtable discussions... Really the only limiting factor now is the phone link for most of us... Those people with the high speed interconnects should already be able to do that...

True, when I log onto those BBS's (or watch them print Packet generated traffic) they are in Upper/Lower case... But watch a QSO... Mostly a holdover from RTTY... All UPPER CASE... Most haven't read the manual to know how to turn it on...

Perhaps that Internet adage RTFM applies here... ;-)

>I also don't see what's so difficult to get amtor going. It requires a
>transceiver with fast rx/tx switching, but that is not a problem with

It's not the equipment that is the problem... It's hooking it up, getting all the TNC settings correct and then reading the manual and learning how to use the software which ultimately has to be configured correctly... And, of course, you have to know what key to press to get it to connect...

>Those who don't know what they are doing will have problems with any mode :-)

Sure 'nough... I hear that on RTTY regularly, too... What it amounts to is those hams left on the digital modes are those hams with the tenacity to make it work, because for the average ham it is not easy... Right now this is one of the major problems with digital ham radio... It's also the reason there are more "old timers" on digital... The new guys only know how to take it out of the box and plug it in... MAKE a CABLE, Oh, no...!!!

HOLD ON here...!!! This is going just a little tooo, far... ;-)

At the beginning of the 21st Century, we really should be teaching future hams to work a keyboard as opposed to working a straight key...

Actually, the reason CW is so popular today, is that it is simple to plug in the key and the headphones (although, I have known a few who have problems with this)... And CW, because it is the only mode that involves a physical skill, is satisfying to the operator as having accomplished something worthwhile... The appliance operators LOVE CW... The technicians love the other digital modes...

During hurricane Andrew and miscellaneous less flamboyent disasters, Florida
disaster management officials who **used** to share your opinion discovered
that
1) A typical hand-held cellular phone battery doesn't last nearly as long
as the typical disaster. They weren't prepared for that.
2) Commercial radio networks of all types (cellular phone, trunked radio,
and even police and fire department repeaters) tend to fall victim to
the disasters.
3) Cellular phone networks, in particular, rapidly choke with the volume of
traffic they are asked to handle during emergencies, if they are working
at all. Everyone who owns a celphone seems to think they need to provide
on-the-spot reports to all their relatives, and true emergency
communications can't get through.
4) Despite years of claiming they were working on it, inter-agency
communications capability often just doesn't exist. Fire chiefs of
neighboring communities don't have common frequencies on their radios,
etc.

... and more.

As a result, the state of Florida officially endorses the use of Amateur
Radio as a backup communications medium, to the extent of requiring that
local disaster management plans include plans for the use of Amateur Radio.
Why? Because experience has shown that hams can get messages through when
no other method can. And handle them on a prioritized basis, so the really
important stuff doesn't get choked out by the trivia. Not all of this is
really NTS, but it is all closely related, and the key is that PRACTICE is
important. That, in my mind, is the real benefit of NTS. It provides a
forum where hams can practice moving traffic WITHOUT CORRUPTING IT.
If you've ever participated in a RACES drill where 90% of the hams
participating had never handled formal traffic before, you know that
getting the message through uncorrupted is not something most hams can

do without training and practice.

I don't advocate retaining your old address when you move, nor do I object to subnets that make sense.

But there are people who want to do truly clueless subnetting like dividing Los Angeles into tiny little districts that can already talk to each other and which won't be routed via community routers. That's the kind of subnetting you want to avoid.

As I say, subnet when there's a reason for it. Don't when there's not.

>listened to obviously ticked off hams start sending a rapid series of dits
>on top of the digital station (I assume to jam ?) I've connected to these
>interfering op's and they apparently had no regard for what they were doing.

this shows some dumbness on the part of the QRM'ed operators. automated stations will be more stubborn than cats and will simply outlast the interfering station who'd rather be doing something else anyway.

it'll be the same argument as with W1AW...there's a schedule, a list of frequencies and when it's time for bulletins or code practice or whatever, they come on the air ...

let's get all the automatic guys onto a few frequencies - tell everyone where they are and the fact that the automatic stuff should be constantly busy should be enough to keep the rational out.

or is this approach just too simple for everyone?

no doubt someone will have to build an automatic QRM'er so he can "show 'em".

Perhaps the FCC/ARRL should have a clause that automatic operation is
permitted ONLY if the station is equipped w/software that monitors the
frequency before coming on-line. Certainly today's modern receivers have
this capability, and anyone planning to do auto-operation has pretty recent
equipment. Don't our regulations also state we can not interfere w/stations
on frequency. At the very least, NAL's should be issued to interfering
ops as an 'incentive'.

Let's not forget the possibility of the Internet NOT BEING AVAILABLE due to natural disaster, fire, ect. The computer networks are indeed wonderful things to communicate with, and usually very fast - but let's not forget how to communicate without the benifits of 200 miles of wire, six satillite links, another 20mi of fiber then another 100 miles of wire.

Also, just try to connect via modem to another computer on a bad line at speeds greater than 2400 baud without an error correcting modem - it's not a pretty sight.

(Ian Anderson,
'Heavy Horses'
Yes, communications has passed us by, already, in many ways. In fact, I'd anticipate that in future WARCs, there will be less interest in the HF spectrum, and more in VHF and UHF, where the birds fly. Even 'broadcasting' as we know it will become less and less of a desirable activity.

However, there will always be the demand for a technology that will allow world-wide communication, depending on no outside entity, using a few parts cobbled together for few dollars. CW is horribly inefficient, even when the band-width argument is made, compared to SSB when it comes to throughput of conversation. Yet, it lives on.

And when it gets down to it and, heaven forbid, this old world should really go to hell in a handbasket, ether will still respond to the tickling of a few watts. And if it doesn't, there will still be those who find value in the fundamental training that economical, world-wide personal communications offers.

While an HW8 can't match a cellular phone hooked into a satellite network for utility and efficiency, there are other values and measures to be considered.

So, 'Bring me a wheel of oaken wood
a rein of polished leather...'

> -Matt

Why drag our butts? Why settle for a magnitude slower? Why go with 400Mhz? Sure it was hot stuff in the forties as was 1200 baud 10 years ago. How about an S-band spread spectrum(direct synthesis) kit. Something that will enable hams to carry multiple conversations or high speed data streams at once. Dream a little dream. What would be the requirements? Digitized compressed video would be one. Perhaps a minimum of 56k data channel. Digitized voice to be carried over the backbone. Everyone having a personal mailbox or line code for IRC type comms(with the aforementioned video). Help me out here what else would the standard need. I just attended a meeting for distance learning over the internet. Its not there for the majority. We can lead the way. Lets go, get this big ball rolling.

The service manual shows the wiring diagram of the mic. I think they
use a couple of resistors to vary the voltage (or current) fed back
to an A to D to distingush between the various buttons. It's simple,
I just don't recall clearly what it was.

You can get a Data Engine version. Not sure what other 80x86-compatible
TNCs there are out there.

Another approach is to use a cut-down PC with no disk drives and put in
a rom-boot board which can then load Dos and BPQ.

W1AW's experience may be a bad omen for the semi-automatic digital stations. Despite the fact that W1AW only uses one frequency per band, at only certain hours of the day, using a widely-published schedule that rarely changes, and has hundreds of users, there has STILL been a fair amount of bitching and complaining about it.

The digital stations will come on in much greater numbers, at random times with no published schedules, with only one pair of users per frequency. (Even if you count each message originator as a "user", it's still less than W1AW.) I expect the bitch level to be +30 or +40 dB. :=)

Certain packet nets in my area are using the AEA PK-96 packet controller
for 9600 baud communication. I've been thinking about building a DSP-
based modem that would implement the same modulation techniques used
in the PK-96. According to AEA literature this unit uses K9NG and G3RUH
compatible direct FM. Where are these techniques described?

2273. PI/PI2 driver update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-15 04:02:34 UTC
From: dp@hydra.carleton.CA
Message-ID: <Csyr8B.6JC@cunews.carleton.ca>
Source record: 48367

A driver update is available which improves performance for the B port on
PI and PI2 cards. Depending on the host machine, it should now be capable
of 9600 baud (on 386 class machines). Also included is a bugfix that should
eliminate rx overruns.

This update is for the NOS source code. The Linux driver update will follow.
It is available for ftp from hydra.carleton.ca as:

pub/hamradio/packet/tcpip/pi2/pi.c

2276. TAPR/AMSAT DSP-93 Kit Announcement

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-15 07:14:23 UTC
From: gjones@tcet.unt.edu
Message-ID: <305d0f$bv5@hermes.unt.edu>
Source record: 48368

DSP-93
The TAPR/AMSAT Joint DSP Program

In July 1988, TAPR and AMSAT entered into the Joint DSP Program, in order to fund the development of an eventual DSP unit for amateur usage. As of the 1993 Dayton Hamvention, the direction of development was focused on a modular, standalone DSP system proposed by Bob Stricklin, N5BRG, in Dallas, Texas. The Stricklin KISS design, later renamed DSP-93, offered many of the things that the initial design goals of the project had specified. Fifteen months after the decision was made to proceed with the DSP-93 development, TAPR and AMSAT are both proud to announce that orders for kits will be taking place July 15th through August 31st for the first 150 units.
The DSP-93 is a complete kit (including box and power supply).

If you would like the full announcement, drop me an e-mail and I will forward it. It is a little long.

Cheers - Greg

Brian Mahaffy (brianm@boi.hp.com) wrote:
: Richard Dreher (RICH@spudboy.uwc.edu) wrote:
: : Thomas Baden (marsh@crash.cts.com) wrote:
: : : Are there implementations out there for use on a
: : : Unix-like OS?

Back to the main question. Can Linux talk AX.25? Yes. I'm
doing it right now. I've tried two solutions for this, they are:

o Get one (or both) of the following on ucsd.edu

o Wampes
o JNOS

Both will compile fine, and run. Then what you do with these
is establish a SLIP connection through a pseudo tty. If you want an
example of how to do this, E-Mail me and I'll send you my startup
script with this loophole exposed.

The other option is to get the AX.25 drivers for Linux. They
are on sunsite.unc.edu.

Pittsburgh PA is going about it this way.

They encapsulate the TCP/IP packet in AX.25 (as per norm), and
it does work. The problem is security. (oh great, here come the DOS
bible thumpers at my door again.) You see, I'm talking about FCC 3rd
party traffic laws here. I almost got pulled over the other day.
If, for instance, you have an Ethernet
network at home, or you're connected to Internet you can have a
problem here. Other people on your network are going to be able to
connect to the packet network if the route to the packet network get's
published.

I don't know about you, but that bothers me.

So, when you run LINUX and JNOS, you can make certain that
packets don't get through to the radio network.

Right now we're sucessfully running 9600bps packet for under
$360.00. I don't know how much cheaper it can get. Plus, we're all
running the TCP/IP software, and it's surprisingly fast.

Next question I can hear coming is, "Does it understand
NET/ROM?"

When you run JNOS you understand NET/ROM, so if you run LINUX
with JNOS you're set. The regular AX.25 drivers for Linux do not (or

I don't believe) that it supports NET/ROM. That's an added benefit of running JNOS.

See, look here:

```
[2:37am] [~] 1 % w
2:37am up 109 days, 10:29, 2 users, load average: 0.14, 0.05, 0.01
User tty From login@ idle JCPU PCPU what
root tty1 Mon 4pm 2:46 3 sh ./doit
kjv tty4 2:15am 17 21 tin
[2:37am] [~] 2 % uptime
2:37am up 3 days, 10:29, 2 users, load average: 0.12, 0.05, 0.01
[2:37am] [~] 3 %
bash# route
Kernel routing table
Destination Gateway Genmask Flags Metric Ref Use Iface
exuco1.exucom.c * 255.255.255.255 UH 0 0 38 lo
vhf.n2vqm.ampr. * 255.255.255.255 UH 0 0 0 sl0
44.69.235.0 * 255.255.255.0 U 0 0 0 eth0
44.69.0.0 * 255.255.0.0 U 0 0 0 sl0
bash#
```

While anything that goes out to 44.69.0.0 goes out the network port "sl0", anything that goes out to 44.69.235.0 ethernet. "sl0" is the connection to the JNOS program.

JNOS handles the routing when the packet get's to it. So it decides whether or not to put it in a plain AX.25 wrapper, NET/ROM, or Mandarin Chinese with a 13 character rotation if you like.

Plus, this machine has been running solid for 109 days without a fatal stumble. Think of it, you never have to solute your machine with 3 fingers again, normally making the sign of die young and frustrated as opposed to "live long and prosper". Yep, you guessed it. CTRL-ALT-DEL.

I don't know about you, but that bothers me. Knowing that at any moment the machine may have a nervous breakdown and just give up. I could picture a TSR for DOS that when CTRL-ALT-DEL was pressed it would find your modem, and dial the crisis hotline.

But seriously. 109 days, not a stumble. It chimes hourly for me, and plays my MIDI files. And with the UNIX shell scripting and the SoundBlaster and a RS232c touch tone decoder it would make for one heck of a repeater controller. How about Repeater Voice Mail anyone?

Phone patch is a snap.

Now, what's really scary is this.

Speach -> Text conversion, and Text -> Speach conversion, right on the machine? Think of it, you key up your radio, and say, "HAL?" And the repeater says, "Yes?"

You could say stuff like, "System Status Please". and the machine reports back how many people are on your machine whether they're dialed in on modem, or logged in through packet.

All it is is Speach to text piped into a UNIX shell script with a whole bunch of "case loops".

If nothing get's through the first 10 loops, the machine times out and goes back into attention mode. Awaiting it's name.

But, it's not that simple, you'd have to take the speech and pipe it through a spell checker with a very limited dictionary of words, and always substitutes something reasonable. This insures that the machine will understand the person.

Also, does anyone know of a program that samples sound, compresses it, and can broadcast it over the network? Because if this is so, potentially we could link long distance repeater networks over Internet.

Think of it... You key up the repeater, and dial the area code of Hawaii, and you're talking half way around the world with radio.

I wonder if some universities would like to take part in this experiment?

Man, the ideas I've had. All I need to do is come up with a way of making video links across internet. Need bandwidth, many much, lots of bandwidth.

Light would work. Demodulate light... Hmmmmmm.... Prism anyone?

Problem is with light, it lends itself really nice to networking. Problem is, we've got to come up with a switch that's fast enough for it. Then also, communications at high speed over light also require a fiber optic. Even a laser has significant loss over long distances.

Hmmmm... I think it's a philosophical question now, because we're using something we don't know if it's energy or a particle. I think that a particle is just energy (a wave) that's self containing. In other words, it folds in on itself in all 3 dimensions. And when you hit the harmonic of that energy you get an atomic explosion. How else would energy convert itself into matter.

Course, there is two types of matter now. There is the regular, "matter", and then there is the "doesn't matter". The rest of the text below this line fall's into the "doesn't matter" cattegory. 73's...

: : A Linux buddy of mine told me that you should check at
: : sunsite.unc.edu for the AX.25 stuff for Linux.

: The stuff on sunsite is not exactly what Thomas is looking for. It
: only has an improved version of one of the utils included in the package
: that he is looking for.

: From my ftp_sites file:

: Site Directory Contents Notes
: ==================== ==================== ==================== =======
: sunacm.swan.ac.uk /pub/Linux/Radio Linux AX25 driver

: This is the only site the author posts his work on. Someone told me why once,
: but the reason escapes me now. The stuff that Alan (GW4PTS) has done is
: top notch. I use it regularly.

: From the directory indicated above locate the version that is applicable
: to the version of the kernel you are running and grab both the kernel and
: user side tgz files. The instructions are fairly straightforward.

: The package make AX25 just another network port (shows up as a SLIP
: connection). Its wild to be able to telnet between Linux boxes via AX25.
: The utilities provide standard type of packet connections if you aren't
: doing TCP/IP.

: Have Fun.....73 Brian.

2278. Re: NTS traffic

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-15 10:31:04 UTC
From: smiller@intelsun.rus.uni-stuttgart.de
Message-ID: <305oh8$1ur3@info2.rus.uni-stuttgart.de>
Source record: 48369
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

: > The NTS is an obsolete system for transferring small bits of information
: > in an inefficient way. It is primarily of interest to old-time hams.
...

Let me add a few of thoughts to this thread...

1. NTS has embraced packet radio (though some old-timers were opposed to this idea at first). Why do so many packet users shun NTS?

2. NTS is extremely valuable to amateur radio. I'd recommend that ANYONE handling third-party traffic at least spend some time learning NTS. NTS teaches discipline, accuracy, and speed. Sure, messages get lost sometimes, but that's only because this is a hobby, and some people don't let it take too high of a priority in their personal/family life. Errors in messages, lost messages, etc. cannot be attributed only to NTS. Why can't some of the NTS methods and techniques be additionally adapted for situations when only Packet radio will be relaying the message (i.e., to handle messages > 25 words)? Perhaps a new "HX_" preamble code that means "This message not suitable for being relayed by voice or CW -- keep it in the digital TTY network; cancel and notify originator if not possible." ??? And of course we hams could put our heads together and find a solution to the problem of people forgetting to delete messages they pick up on Packet and deliver.

3. You hams in the U.S. should appreciate what you've got: in Europe and most other parts of the world, third-party traffic is illegal. THERE IS NO NTS HERE! Take it from an American who loved traffic handling in the U.S.: a BIG chunk of the fun is taken out of amateur radio when you can't pass messages for/to others (non-hams). And be aware that the European governments have attempted to persuade the U.S. government to outlaw third-party traffic in the U.S. as well. Check out the ARRL FCC Rulebook for some history on this.

4. I used HF AMTOR/PacTor, and the VHF/UHF Packet network, to communicate with my dad (N7APE) and brother (AJ7X) on a daily basis for nearly 15 years. Though we are still interested in amateur radio, we now use Internet Email to communicate, especially when HF propagation is not so good between Europe and the West Coast, but also due to the third-party traffic restrictions we now have imposed on us as a result of my relocation to Germany.

I'd be happy if, at some future date, NTS was replaced by an ITS (*International* Traffic System) that embraced all modes (and users of all modes embraced ITS). I suppose I'm dreaming though...

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Thanks for posting the info Django. Has anyone the time to translate the
documentation, and has anyone tried this circuit out ? Tips on antenna/rx etc.
much appreciated. I hear good things about Hamcom regularly, and would be
interested to try it out for wxsat if I can get hold of a suitable rx.

Hi All,

Can anyone tell me the format of the command sent to an FBB BBS
as an Unproto frame to request an Unproto list of bulletins and messages
from the BBS. The basic format seems to be:-

? XXXXXXXXCC

Where XXXXXXX is the starting number of the messages to list in hex.
CC is a 2 digit checksum.

In particular I would like to know how the 2 digit check sum is calculated
from the message number.

Thanks in advance .....

[about Alan Cox's ax25 code for Linux]
>: The package make AX25 just another network port (shows up as a SLIP
>: connection). Its wild to be able to telnet between Linux boxes via AX25.
>: The utilities provide standard type of packet connections if you aren't
>: doing TCP/IP.

I've been running JNOS/Linux for several months now with great results. I'm interested in Alan's code, but unfortunately at the moment the docs are a bit thin. Maybe you can help...

Running the ax25 kernel code and utilities, what sort of standard ax25 capabilities do you have? I know the "call" program lets you make an outbound zx25 connection, but what if someone connects to you with ax25? Do they get a login prompt? Or do they have to come in via a udp/tcp service to be able to do anything?

Also, I've heard reports that since the Linux networking code doesn't (yet) support different window sizes, IRTT, etc., per interface, performance in the radio world suffers unless you have a fast and nearly retry-free channel. I don't know how much truth there is to this, though...

Good idea, Andy. But that's not what ARRL is recommending to the FCC, and the FCC is going with the ARRL recommendation in its notice of proposed rulemaking. The ARRL plan specifically allows semi-automated stations to operate in the same sub-band as the human to human digital operations.

For some reason a lot of people in ARRL seem to think that that is a good idea. Despite the fact that the automated side of such "qsos" if that's the right term, will not listen for qrm before transmitting, as a human would be required to do. It's a darned shame.

I agree with what you say, though.

You *are* using an external antenna, right?

PC's make all kinds of RF. I have a Gateway 486-33 at home,
and I can't have the HT with the rubber duck within 5
feet of the thing.

When I connect my HT to my Ringo Ranger II on the roof, the noise
goes away. In fact, I can place the HT on top of the PC chassis,
and it works fine.

One note, though is that semi-automatic stations are NOT permitted to
beacon, or in any way initiate a communication. They must also be 500Hz
wide at most.

There is certainly plenty of opportunity for QRM, but the feeling was that
these restrictions would limit such.

>

A lot of folks were in favor of this method of operation. Since those
folks were vocal, they got listened to.

I've never build any uhf circuits but what do you need but a tv tuner, prescaler, phase comparator, mixer and an amplifier. I've seen 2GHz prescalers and 20 watt 400-500MHz amplifiers in Newark. Minicircuits sells mixers. Perhaps designing the matching networks is difficult. If someone has the equipment to analyse at these frequencies I can get the parts.

Mostly none of the above. It was the bunch of good ole boys who hang
out on 3975 kHz. Few of them are NTS members, fewer still are members
of RACES or ARES (those mainly operated on VHF supplying tactical
comms). The old boys did a pretty good job in between gall bladder
stories. They've all known each other for years, and like most back
fence gossips, they passed along information surprisingly quickly.

(The above is my impression from the snippets I could hear. My HF
antenna is still down due to the fallen tree.)

Why do you say that there are only one pair of users per frequency?
That's only true of things like RTTY mailboxes. It certainly isn't
the case with channel sharing protocols like packet, and it's HF
varients. Monitor 14.109 for a while and tell me there are only a
single pair of users on the channel.

Admittedly, the current HF packet protocol doesn't share the channel
very *well*, but it does share. There are other link protocols that
can share the channel efficiently. HF *may* be a case where token
ring techniques would work better. The new rules will allow us to
experiment with such things without having to get a STA.

Actually, packet stations enforce CSMA, so they *do* automatically
listen before transmitting. Your concerns only apply to things like
RTTY mailboxes which don't have a protocol that requires channel
sharing. I tend to agree that *those* types of stations are abusive
of frequency reuse.

Sounds like a business opportunity to me, Brian. GRAPES has expressed
interest in negotiating non-exclusive manufacturing licenses. Unfortunately,
none of the current US packet manufacturers have expressed any interest
in discussing such a license. Remembering that all the current manufacturers
started as garage operations (and some still are), this might be a way to
get into the business.

Hi everyone, I am wondering what it would take for me to get on digital Hf, I have a Yaesu FT301 (fairly old but works fine), and a Macintosh Se.

I know next to dirt about the digital realm but from what I've heard, it sounds fun. So what do I need, how much and where do I go to get it?

I have my general class licence.. 73's es de N0ZYA Waterloo,Ia -jmp-

An IBM and a Hamcomm interface *ducks*... yeah! Now I'm flame bait 8-).
I think there's a Mac program out there somewhere that uses the Hamcomm style
interface (but kludged onto a Mac serial cable..)

2308. AX25 for AmiTCP (Amiga)?

Newsgroup: rec.radio.amateur.digital.misc

In the latest beta version (3.0b2) of AmiTCP, the Amiga TCP/IP stack, the readme files mention a SANA2 compliant AX25 driver for the Amiga written by Dave Martin. I have archied myself out looking for this module (ax25.device or axdm.device) and would appreciate it if anyone can tell me where to obtain it or how to reach Dave Martin, its author. Thanks and 73 de KA9NZI.

: Actually, packet stations enforce CSMA, so they *do* automatically
: listen before transmitting. Your concerns only apply to things like
: RTTY mailboxes which don't have a protocol that requires channel
: sharing. I tend to agree that *those* types of stations are abusive
: of frequency reuse.

: Gary
: --

Yes, those types of stations are those I'm addressing. My original post
here was about ***semi***-automatic station. Those are stations which
have a human on one end, and a computer hard disk :-) on the other. My
point being that those types of stations belong up with the packet and
other fully automated stations, and not intermixed with the
human-to-human stations.

Semi-automated stations are generally your aplink and paclink chaps, and
(I guess) RTTY mailboxes. (I don't work RTTY, so don't know much about that).

Semi-automated stations have an inherent problem that the automated end
of the connect does not listen for qrm before transmitting, as a person
would. Hence the qrm. This happens now depressingly often on HF digital.

From: k9cw@prairienet.org
Message-ID: <30bk47$nb0@vixen.cso.uiuc.edu>
Source record: 48305

APLINK and Winlink stations have been operating for years in the same sub-band as the keyboard to keyboard users without much interference. Generally, the problems come from a couple of the aggressive BBS programs that beacon ID's and mail lists, not the semi-automatic APLINK like stations.

Even if (or when) we are allowed unattented HF semi-automatic opertion, I would not expect an explosion of these stations. Putting a VHF/UHF BBS on the air takes only a transceiver, TNC, and computer. HF BBS's need a network for forwarding and users who will connect. If no one links to the semi-automatic station, there is no interference.

The FCC NPRM does squeeze the packet stations. Few or none of them will be able to meet the 500Hz requirment for unattended semi-automatic operation. Unless the bring the data rate down from 300 baud, that is.

73, Drew

Hmm... Maybe I need to read the NPRM to check for changes. The
original proposal said, or implied, that semi-automated stations must
be triggered by a locally controlled station. Automated stations
could NOT trigger semi-automated stations. That was the idea behind
it in the first place. The control op at the locally controlled
station was responsible for checking the freq before he could initiate
the connect with the semi-automated transmitter.

I'll be first to admit that I haven't had the time to fully read the
current proposal.

The answer to your question is "YES".To copy un-proto data to a disk
file you switch to the monitor screen (F10) and then issue this command to
baycom.
:W DOVE.LOG
This will copy all data recieved to a file called Dove.log .
To copy all recieved data to the printer you do the same thing as
above
but the command looks like this;
:W PRN

Good luck and have fun with DOVE.

How many of you leave the factory default TNC settings alone and not opt for the more 'agressive' timing to 'transmit immediately' when the frequency is clear. Be honest folks. That contributes to frequency clutter. These packet hogs can't even hear the stations trying to get in between the packets.

Message-ID: <BAT.94Jul17223325@gdstech.GRUMMAN.COM>
Source record: 48320

If you want to save any packets directed to your
call in a session to which you are connected,
you simply type the command ":w filename" where filename
is what you want to call that data. Baycom will tell
you that the file is open, and you will see the
accruing byte count at the right edge of the lower
status bar. If you wish to capture ALL packets that
are being decoded, those being sent to other stations,
it's also quite simple. Just hit F10 to get into the
Monitor window. Then type the :w command as above. Now,
every incoming packet will go into that file. This is
useful for catching Shuttle or Mir stuff when you are
asleep. But, on a busy frequency, that file can get real
big in a short time. -pat

I've found that my video card generates the most noise. By
putting ferrite beads on th video cable, and rerouting it, I have
reduced PC noise a lot.
But, as the other guys are starting to tell you, running packet on
a low, inside antenna, is making you a hidden transmitter to most of
the other stations on your frequency. Packet collisions will abound,
total channel thoughput will suffer. All the other guys will have
degraded performance. Because of you. You really need to run a high
antenna, and MORE power. At least 20 watts. Remember, for the system
to work, each packet station must be able to hear every other station
on frequency. If you can't comply with these minimum requirements,
you will be creating a negative impact to dozens of people in your
packet neighborhood. Please be a help to your ham friends by getting
up there where they can hear you. -pat

: Does anyone have any input on the KAGOLD or HOSTMASTER II
: software. From the literature KAGOLD does not use a mouse and
: HOSTMASTER does.

: Would appreciate any info.

Hello Dave..

I have experience with both programs - I would, without question
recommend KAGOLD! HM2PLUS is (was) good in it's day, but it is
old, and not much support from Kantronics. This is not a slam
against the fine folks at Kantronics, just a fact that we and
they are aware of. On the other hand, KAGOLD is a fully supported
software product with programmers at the other end of the phone/
internet that listen to it's users - refreshing.

KAGOLD runs under windows if you want, or under DOS. Many, many
fine features, too many to list, so my vote is for KAGOLD - ok?

: How should this hook up? I have the pinout for the kenwood connector, but
: don't have a pinout for the 9 pin DB9 connector on the Kam.

: Appreciate any help. Please reply to gcoombes@calvin.stemnet.nf.ca

Hello Greg..

Try this out:

" The VHF radio connector on the KAM Plus rear panel is a 9-pin DB
style connector with a pre-wired 9 conductor cable and a mini-plug
attached. The cable wiring is:

Pin Number Pin Name Color Function
1 AFSK white Transmit Audio
2 XCD yellow External Carrier Detect
3 PTT brown Push to Talk
4 RCV blue Receive Audio
5 GNDRCV * Receive Audio
6 GND shield Ground
7 N/A red Not Used
8 GND green Ground
9 GND black Ground

* Center of Mini-Plug (audio from radio)

Hope this helps you out Greg.. 73 de Mike

```
The DSP-93 text is now available on the TAPR Internet server.

Send mail to 'file-request@tapr.org'.
In the message body include: GET /pub/tapr/dsp93.txt

This will get you the complete announcement on the TAPR/AMSAT DSP-93 kit.

You can also get an entire directory of TAPR files with the DIR command.
Help is received by using HELP in the message body.

Cheers - Greg

TEKK MINI Radios.

Okay folks... Here is the catch... Recent experience here in
Buffalo has found that on the MFJ-9600 you have to take the jumper off
on JP2 of the 9600 modem itself.

This yielded a .28 return time on 2 character ping/ICMP echoe
requests.

Take a look at this:
```
[12:32am] [~] 1 % ping -i 1 -s 2 uhf.n2njh.ampr.org
PING uhf.n2njh.ampr.org (44.69.233.4): 2 data bytes
10 bytes from 44.69.233.4: icmp_seq=0 ttl=28
10 bytes from 44.69.233.4: icmp_seq=1 ttl=28
10 bytes from 44.69.233.4: icmp_seq=2 ttl=28
10 bytes from 44.69.233.4: icmp_seq=3 ttl=28
10 bytes from 44.69.233.4: icmp_seq=5 ttl=28
10 bytes from 44.69.233.4: icmp_seq=6 ttl=28
10 bytes from 44.69.233.4: icmp_seq=7 ttl=28
10 bytes from 44.69.233.4: icmp_seq=8 ttl=28
10 bytes from 44.69.233.4: icmp_seq=9 ttl=28

10 bytes from 44.69.233.4: icmp_seq=18 ttl=28
10 bytes from 44.69.233.4: icmp_seq=19 ttl=28
10 bytes from 44.69.233.4: icmp_seq=22 ttl=28

--- uhf.n2njh.ampr.org ping statistics ---
29 packets transmitted, 17 packets received, 41% packet loss
[12:33am] [~] 2 %
```

The 41% loss is due to the fact that there is other traffic on
the frequency besides the ICMP that my station can't here, but n2njh
can.

What this means folks is that when doing a real Telnet session
a packet is transmitted for every character. Un-like JNOS, or any
other NOS variant which transmits a packet for every 200 characters or
when newline/CR is pressed.

Single character IO is quite tolerable at 9600bps.

Now that single character IO is possible, there is one thing
(at least) that we must take note of.

Use the same strategy in the NOS TCP implementation, but make the single character IO (telnet/rlogin) get through before the other packets do. This makes it possible to have several FTP or (batch) transfers taking place while someone is doing something else w/ telnet.

We seriously have to consider these facts because when we get into limited bandwidth (6Khz or so) we're pushing the boundaries a bit, and it should be treated the same as a phone connection, but only half the speed. (1/2 duplex remember.)

So, if we employed the same strategy PPP uses to do this, we should have an easy time at it.

Also worthy of note is I noticed that JNOS supports PPP.

Maybe if they used the same function as in the JNOS implementation when scheduling packets to go out AX.25 as with PPP.

This would increase the usuability of packet for interactive sessions.

Course, most people would argue that if NOS is used correctly it could all be batched traffic.

I just wish I could get programs like talk, and IRC on packet.

Now, would you listen to me if I told you that this can be done for under $400.00

Thought you might...

TEKK Incorporated
228 NW. Parkway
Kansas City, MO 64150

(816) 746-1098

Inquire about the TEKK Micro. It's $90.00 You can request crystals for the radio. We in Buffalo Decided on 441.050. Ask for a service manual when you order it. (They don't send any paperwork, not even pinouts! Although a BNC connector is rather obvious, you may stumble when trying to trace back the DB9 connector.) If you decided on the TEKK Mini, before you try and do anything with it, remove Capacitor C18. It's SMT, so be sure to have a fine soldering iron and no coffee that morning.

CAUTION!!! Do not run the radio at more the 12.0V until you're sure I'm not kidding. CAUTION!!!

Next, get an MFJ TNC, (1270B Personally) about $140.00, and the MFJ 9600 Modem. Another $100.00

Install the modem. (READ THE MANUAL FIRST! Believe me, they're "Instructions", not "distructions"!)

Coax, and an Antenna are equally as important. Get the low loss coax, and a nice antenna, another $60.00 should suffice. I have the UHF IsoPole.

Next, stick the antenna in a very high cool dry place. ;-)
And most importantly, a well ventilated area... ;-)

Next: Pour the mixture into a UNIX box stir, let cool, and wellah! You've got yourself a real OS, and a REAL network. CAUTION! Do not mix with MS-DOS! Warranty Void!

MS-DOS will cause problems. You will have to re-boot your machine whenever it decides to mis-manage it's RAM. I like to call it a nervous breakdown. Yes, I am certain that you will have to do this. You will have to give your machine a 3 finger salute quite often, but less than usual use.

Can you do this in windows?

Yeah, you can. Problem is that you can't have any of the nice TCP/IP apps work with it. Something like Eudora, or NewsWatcher will never happen.

That is, unless you do this workaround. Take two Ethernet cards, or two serial cards and create a network connection for Windows, and one for JNOS. Either over Ethernet, or a SLIP/PPP link.

Problem is that you need to figure out how to do this because usually both programs have to run at the same time. Okay, so you have Windows fire off JNOS, but how does the DOS Networking software connect to something that isn't there yet because Windows isn't running?

Well, simple logic will tell you the cheapest way out is a PC, floppy, Monochrome Monitor, and an Ethernet Card, or serial port. Done deal, functional, and cheap.

(Hey, I know you all think I'm nuts, but seriously, this would work!)

Now the problem is routing TCP/IP packets off of Packet, and onto the network connection to your PC. (Oh, you're network coordinator is going to need to buy stock in Malox for this one!)

Routing has always presented a problem, and always will. The problem is our range. 5 Watts uhf doesn't go to far (please note the very high cool dry place comment above).

Now, we need a way to do bit regeneration (IE, very fast digipeater) without bothering routing.

Two TEKK Micro's, and 1 9600bps modem will do nicely for this. Input frequency, output frequency, it's half duplex, and goes both ways. The TEKK Micro's have a 3ms keyup to stable time. Put this gadget on a nice repeater tower near you. And you divide the network

distance. What you do is take the frequency of one area, and
bit-regenerate it on another.

IE, RX -> TX, and TX -> RX. No TNC needed. All you need the
modem to do is regenerate the bits. Course the frequencies have to be
different, but so what.

And we increase the chances for a collision by a little bit,
but having this device installed fixes things a lot more.

The only thing you will have to do is set your TXDELAY by
approximately .0096/sec + .0006 (9600bps + 3ms*2 radios stabilize
time) = .0102/sec. So we'll settle for 2 hundreths of a second
TXDELAY. Not bad at all if you ask me. Some of you may be asking why
I'm using 9600bps as a value, and I figure that the difference between the time
where the TNC get's the digital information and actually starts to
make it analog (modulate it), that it's going to be about that long.
(I could be wrong, but then again, I'm talking about pushing the
envelope here.)

If anyone has any questions, please feel free to E-Mail me.

And I'd like to thank the following for helping us do this:

MFJ
TEKK
KC2P
N2NJH
N2VQJ
And many others for making this possible, and affordable.

And, thanks most of all to:

Linus Torvaldus (Spelling), creator of Linux for bringing us a
REAL OS at no commercial cost involved.

Hi. I just got an MFJ-1278B multi-mode TNC. It seems to be working pretty well, but I can't seem to get the mailbox going. I have the MAILBOX parameter set to ON, but when someone connects to my station, they don't get the mailbox. I can't find anything in the manual that addresses this. How do I set things up so that the user gets connected to the mailbox on connect? Thanks.

>William Vaughn vaughnwt@olympus.net "Just plain Bill."

GRAPES is the Georgia Radio Amateur Packet Enthusiast's Society, IE the Georgia state packet networking group. GRAPES distributes kits of the WA4DSY 56 kb RF modem described in the ARRL 6th Computer Networking Conference Proceedings. Since it's introduction in 1987, GRAPES has shipped thousands of units worldwide, and uses them internally for the state network, which now extends into Tennessee, Alabama, and North Carolina. They are used in many countries, including Britain, Sweden, Japan, and the Netherlands. The largest group of amateur users outside Georgia is in Canada where they have setup a full duplex network. GRAPES has also sold units to governments and research agencies where they are used for telemetry of remote sensing data, and for remote control.

The modem uses MSK (Minimum Shift Keying) and occupies 70 kHz bandwidth for a 56 kbit/sec data rate. The ARRL bandplans allocate 100 kHz channels for their use on several bands. The proposed 219 MHz band will all be 100 kHz channels for 56 kb trunking operation. The modems have a tracking data detector circuit that will continue to deliver full sensitivity error free data if the carrier center frequency drifts +/- 5 kHz. It will work with larger amounts of drift, but error rates climb if signal strength is not high enough.

The modem is a true RF modem. It *is* the radio, so the hassles of trying to modify radios to work at these speeds is absent. It outputs and inputs in the 10 meter band and a transverter is required to shift the signal up to the UHF band of choice. Units such as those made by Microwave Modules, Sinclair, and SSB Electronics will work. Even the Hamtronics XV4 transmitting converter and receiving converters will work. The only requirement of the transverter is that it be a *linear* transverter since MSK has an amplitude component of 3 db. If a class C transverter or amplifier is used, the modem will still work, but the occupied bandwidth increases significantly.

The modem is, of course, a synchronous modem and outputs Tx and Rx clocks to the digital interface. While you can modify a TNC2 to work with the modem, and GRAPES includes instructions to do that, it's recomended that you use the Ottawa PI card or the Gracillis card in a PC instead. Since these cards have direct DMA with the PC's main memory, they are better suited to support long 56 kb data bursts.

If you use the TNC2 approach, you're limited to an effective thruput of 19.2 kb because of limitations in the TNC. The radio side will run at 56kb, but only in bursts of less than the TNC buffer length since it can't handle the RF side and the serial link to the computer both at full speed at the same time. However, you can use a Kantronics Data Engine as your TNC or switch. It has the horsepower to keep up with continous 56kb data streams. You can also use a Mac directly. It's serial port is capable of synchronous operation at 56 kb.

Basic pricing on the kit is $250. This includes boards, all parts, and instructions, less case and power supply. You have to furnish your own enclosure and +/- 5 volts. You can also buy bare boards and waveform ROMs for $125, but the full kit has the parts priced at GRAPES' cost, so it's unlikely to save you any money to go that way.

Note: these modems do not interoperate with lesser modems at lower speeds, so unless there is already 56kb activity in your area, you should arrange with another ham to buy pairs of them. I've built a half a dozen of these modems, and assembly and tuneup are not difficult. However, I would caution that these are not Heathkits, and some experience with digital and RF circuitry is helpful. The minimum test equipment you will need is a dual trace oscilloscope capable of XY operation to at least 100 kHz. (That's almost any dual trace scope.) The usual RF test equipment, signal generator and monitor receiver, are also helpful, but you can just loopback the transmitter to the receiver for tuneup and testing.

>Gary

If packet stations enforce CSMA (Carrier Sense Multiple Access) and listen before transmitting, what does it mean with regard to not transmitting on other QSO's. The no transmit logic would only be true if the channel had no carrier or (XOR) another transmitting site on the channel had command of the channel and was recognized as transmitting by all other stations listening on the channel. In reality, on HF there is almost an infinite combination of frequencies, modes, codes, and signal levels on HF that can fit between the definitions of silence on the channel and a single packet station recognized as transmitting. So what happens if you fall in that grey area? Do you get stomped on by a machine broadcasting like a beacon?

CSMA topology goes on to say: an originating station, sensing no carrier, transmits a packet, then if it gets no acknowledgement within as specified time inverval, the station transmits a retry. Here is a problem. How does one recognize no carrier on HF? This is easy on VHF, ie. COR's & PL similar to repeater switching, even though intermod can cause false switching there also. VHF carrier sense is also enhanced by the use of NBFM and rigorously spaced channels with sufficient guard from sideband overlap. Not so easy on HF. The noise the machine hears may be another QSO, or it may not. Another problem, how many retries before timeout? One could set the counter to infinite to assure the message would eventually get through!

Of course all of these problems could have and should have been worked out during the 8 year demonstration and experimentation period under succeeding STA's. Unfortunately the evidence appears to point to the contrary.

Given that most (and it should be all) ampr.org addresses are known to the internet, why not just do a domain look-up on your call? I can get a response if I query g4wrw.ampr.org, and it is correct as well!

If you aren't there, then prod your local coordinator to find out why it hasn't been registered (assuming you have allowed a reasonable time to elapse first!!!!)

The Heathkit WWV clock has a serial output. I'd like to know how I can hook this up to Linux so other machines can set their clocks accurately (ie using rdate or xntp over packet or on the local ethernet LAN). I have code for something called "DCF" which is a German radio. Is this compatible or do I need something else? If the DCF stuff is compatible, I see that the Linux patches are quite old, and the serial port line discipline code has changed drastically, has anyone updated the patches?

(Apologies for following up to a follow-up when really wanting to
follow-up the original, but the original never made it here!)

The point made above is a good one, and one I have been reflecting on
myself, following various happenings here in the UK.

Throw this thought into the metling pot: Has the advent of easy dial
international phone calls - in my time as a licensed amateur - made hf
ssb dx working a thing of the past?

I am slowly tending towards the idea that we would be making a mistake
trying to emulate the internet; but should perhaps emphasise a little
more the "radio" part of amateur radio.

Comments? Thoughts? Wrong group? :-)

(You don't know me, so let me give you a little of my background, if
it helps to put my comments in context: professionally I work in the
networking industry, writing operating systems et al for embedded
processors in bridges and routers. I am on the internet from work and
home, so I don't think I am a luddite. On the amateur radio side, I
was first licensed in 1972 and currently operate both vhf packet -
only AX25 at the moment, but that's about to change - and hf cw, and
see no great conflict in enjoying such different aspects of our
wonderful hobby.)

I'm using a Baycom and its software and my Icom IC-2AT HT. Pretty cheap setup.
You should be able to do the same or similiar. The Baycom SW is only for
the PC types. I also have a Mac Plus at home, but it's at home in WA and
I'm here in CT.

^^

This must be a fairly new policy. Didn't seem to be in effect when I was working a weak Cuban a few years back. W1AW came screaming right over us without so much as a howdy-do. Silly me, answering a CQ on a code practice/ bulletin freq.

I just got rid of a MacSE I had used for three years on the INTERNET.IT WAS
A REAL GEM.Sorry about the caps.Right now I am using the PowerPc 6100 .To
answer your questioin I would get the pk88 TNC from AEA and their program
MacRATT which is a Mac version packet program.Then get yourself a dipole or
whatever and look for a locak hf amtor or pactor around 14069-14075 in your
local area.I just got on packet about seven days ago on vhf, much
easier,and am waiting for hf because I live in an apt bldg and have
restricted antenna space.I am currently using the AEA isoloop inside,not
too successfully and am trying to find a way to stick it outside.Getting
on packet is pretty simple.Good luck.

Yes you certainly do. That's a very good reason for practicing strong
channel discipline on HF digital. Just because your VFO tunes in 10 Hz
steps doesn't mean you should operate on just any one of those steps.
We need a bandplan with recomended channelization.

2344. Hamcom program non-functional

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-19 13:25:19 UTC
From: ken@fstop.csc.ti.com
Message-ID: <940719132519@kendurham.sc.ti.com>
Source record: 48242

The simple ua741 op-amp interface for the Hamcom program works fine when used with a program called Hffax (a SSTV and FAX program.) This interface has been tested on Com1 with Hffax. When using Hamcom (a RTTY program), there is no response to the input signal. The screen functions seem ok but there is no signal shown on the Tuning scope or the Spectrum display.

I have tried all kinds of port defintions and designations in the config file of the program to get the program to recognize the port and come alive.

I got this program from a BB called AA5S.

Can someone tell me if there is a trick that I am missing or if the program may be deactivated and only a demo screen. If there is a way to get a good copy of this please let me know. The author of the program is in Germany.

>
>Throw this thought into the metling pot: Has the advent of easy dial
>international phone calls - in my time as a licensed amateur - made hf
>ssb dx working a thing of the past?

No, Dxing is a *game*. It has no serious communications purpose.
The fact that the circuit *is* unreliable is what makes the game
challenging. Doing Dx by telephone is no challenge (well perhaps
it is with some countries' phone systems). On the other hand,
RF digital networking isn't a game. It's about traffic handling.

That can be fun practice or for a deadly serious purpose, but it isn't
a game conducted for score. Random unreliability is not an asset in
traffic handling. Thus there is considerable interest in developing
reliable protocols to deal with the inherently unreliable RF medium,
and there is interest in interconnecting with the reliable wireline
networks in places where they are up and available. RF networking
offers a flexibility not available by wire. If the wire is down
due to storm or quake, the ether is still there. (The same can be
said for SSB or CW traffic handling. The phone system may be down,
but the ether is still there. However, phone and CW protocols have
been developed to about their natural limits in dealing with
RF conditions, digital methods still have lots of room to improve
and grow.)

>I am slowly tending towards the idea that we would be making a mistake
>trying to emulate the internet; but should perhaps emphasise a little
>more the "radio" part of amateur radio.

If you mean Dxer games, that seems heavily enough emphasized already.
The interesting challenge, IMHO, is to develop systems to make the
RF digital domain a useful adjunct to, and emergency substitute for,
the internet. We know there are digital methods for reliably communicating
in conditions where ordinary manual methods fail (see NASA DSN). The
challenge is to adapt those methods, or develop others, for a reliable
amateur digital network.

Getting back to the title of this thread, I think GTOR is a small
step in the right direction. However, it's a bandaid on a hemorrhaging
level one modem. I don't think GTOR is anywhere near the step forward
that Clover represents. The current Kantronics (and nearly everyone
else's) HF modem is a horribly ineffective user of the HF spectrum.
If we were to couple the FEC and compression of the GTOR protocol with
a better modem and modulation, then we'd be getting somewhere. We need
modem modulations that are more robust under HF condtions. PSK is one

direction, MSK too. Another tack is a multi-tone system like Piccolo. Hardware that does soft bit decisions would be welcome as well. ALE techniques to work with a changing MUF would also be welcome. There's lots of interesting work to be done yet before we have a robust RF network in place.

No kidding!!! Although the service manual is suspect. It says put in
50mV of signal and adjust for 3.5 khz deviation. We put in 500mV and got
the right deviation. 50mV is not enough to tickle the thing.

What is the reason for removing C18? We have several here with C18 intact.

Sounds like you want xntp3, the current implementation of the Network
Time Protocol. Check out comp.protocols.time.ntp and the files
available for anon FTP on louie.udel.edu in pub/ntp. I've not yet built
the more recent version on Linux, but much of the reference clock work
has been done for you already; even if you don't need the entire NTP
suite (it's nice to have good time) the already-written code may help.

I have used a Baycom-style modem for over 12 months. It runs very well indeed. I am using Eskay Packet (SP) which provides multi channels and a converse mode to chat with many stations together. The mail box works quite well, when callers get used to the "//" commands. The Baycom software is alos very good. I wouldn't spend any more money to buy a firmware 1200 baud tnc. It just isn't worth the hard-earned cash. I can see no real advantage.

Such modems also work very well with JNOS which requires a software TNC anyway.

Cheers & 73 ... Tony vk2tjf

Just to avoid confusion: what is used here is the HamComm interface, but
the program you need for FAX/SSTV is JVFAX 6.0 written by DK8JV.

HamComm 3.0 does CW/RTTY/AMTOR with the same circuit.

2360. Wireless modem with GMSK and PLL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-20 07:20:54 UTC
From: denouden@inter.NL.net
Message-ID: <Ct89qv.61x@inter.NL.net>
Source record: 48251

I'm trying to design a wireless modem for 900 MHz.

The 900 MHz is synthesized by a VCO. Spectral purity and RF carrier frequency stability demand a PLL for the VCO control voltage.

For data modulation I've decided upon GMSK. The GSMK signal frequency modulates the RF signal by superimposing it on the VCO control voltage.

The problem with this setup is that for low BER the RF modulation/ demodulation response should go down to a few Hz, which is impossible because the PLL would try to correct any RF frequency deviation at this modulation frequency.

How is this generally solved? Some data books mention two point modulation. How does this work?

Hints, references or answers are highly appreciated.

Thanks,

Jan den Ouden

: Here's a koan: If you have ice-cream I will give you some. If you have none,
: I will take it away from you. (it's an ice-cream koan).

the easiest aerial is crossed dipoles over a ground plane. You need 90
degrees phase shift between the dipoles. I will mail anyone further
details. As for receivers the cheapest in the uk is the circuit kit. It
has however a 30k if bandwidth which is slightly short. I use this at the
moment. The white clouds come out noisy because of the limited B/W.

The best value for money is the Remote Image group proscan receiver (50k B/W).

Any questions pse email me.
I remember how hard it is when starting and am only too pleased to help.

>steps doesn't mean you should operate on just any one of those steps.
>We need a bandplan with recomended channelization.

>Gary

Ahhh, but there is the rub! Everyone gets all bent out of shape if W1AW comes up on, say 7.080 Mhz, and blows your QSO away, acting like they own a channel. (Read the comments posted here recently.) But, this is going to be perfectly acceptable for automatic control data stations?? Kind of hypocritical wouldn't you say?

IMHO this is a step in the wrong direction. The incentive to develop robust network topology will be taken away by providing a safe haven for the auto-digital stations. As has been stated here before, the technology exists to develop clear frequency, clear QSO hunting capabilities, so why not press forward with that now and eliminate the necessity for the clear channel crutch?

Baycomm is very good at what it does. It doesn't give you a PBBS, or any flexibility with software -- it's like a TNC with only one terminal program available.

Baycomm uses a lot of computer resources. You can shell out and leave it running, but you have a lot less memory available than you would have if you had shelled out of a conventional communications program with an external TNC. Also, with an external TNC you can stop the communications program entirely and let some input be buffered by the TNC. With Baycomm, if you want to see what stations appear on a packet channel overnight you have to leave the Baycomm program running overnight.

I haven't tested this rigorously, but my impression is that my KAM performs better with marginal received signals than the Baycomm modem. To some extent this may be a function of how well built a particular modem is; I also have a PMP modem that is functionally the same as the Baycomm but is not as well shielded, and its performance on weak signals is definitely worse than the KAM.

2367. Has anyone done packet using Coherent?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-20 15:35:57 UTC
From: jbarr@MCS.COM
Message-ID: <30jg8t$au1@Mercury.mcs.com>
Source record: 48261

I just installed the UNIX variant Coherent on my PC, and was wondering if anyone out there has been able to use it for packet? I run JNOS in the DOS world, and enjoy being able to use TCP/IP. It would be way cool to be able to do this from Coherent. I know that there are AX.25 drivers available for Linux. Are they usable with Coherent? Is there a version of JNOS available for Coherent? Basically, my question is that I have Coherent installed, so how can I integrate Packet Radio with it?

Message-ID: <17.3815.3195@almac.co.uk>
Source record: 48265

Hello All. Thanks for reading this mail. I am wondering if anyone can kindly give me info on following questions!
1) Can I use KAMPlus 7.0 under UNIX operating system?
2) Is there any terminal software which can talk to KAMPlus?
3) How do I connect and initialise the TNC under UNIX just to talk to it?
4) Is there any known public or shareware or even commercial software which will control the KAMPlus under UNIX operating system?
NB: The UNIX runs on Apple Macs and NCSA.
I would deeply appreciate your help on this issue. Thanks!

2372. Packet Ragchews on HF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-07-20 23:52:22 UTC
From: hunley@mti.com
Message-ID: <3416@mtigate.mti.com>
Source record: 48267

I'm relatively new to packet, so pardon the "newbieism" of this question, but I'm stumped:

I have a nice HF packet setup: a Yaesu FT-890AT driving a Cushcraft R7, talking to a KAM-Plus. I hear lots of packet-sounding stuff on HF, but when I tune to it, the KAM seems to decode mostly RR packets, with a few C and DM packets. The very rare I packet seems to contain ASCII garbage, like two BBSs exchanging binary files or something.

When I try to connect to one of these stations, I either get no connection at all, a connect followed by an immediate disconnect, or a message to the effect that "only members are allowed on this node." I have yet to make my first successful QSO using packet.

Now if I want to talk to a BBS, I don't need to use a radio for that. There are plenty of BBSs within a local phone call of my house. I was kinda hoping to make the same kind of QSOs using packet that I was making using CW or voice.

Is there something I'm doing fundamentally wrong, or is there no good old "CQ CQ CQ - Tnx fer call OM, name is John..." type activity on HF? Are there certain subbands where the ragchewers and DXers go, that I just haven't found yet? I know that most packet is on VHF, but I don't have a VHF rig, and even if I did, I don't particularly want to limit my QSOs to stations within a 10-mile radius (yes, I've heard of digipeaters).

From: cmay@titan.ucs.umass.edu
Message-ID: <30kh7s$s5a@nic.umass.edu>
Source record: 48268

I was wondering if anyone could provide me with some information
detailing the different price/performance options available for an amateur
radio setup capable of communicating with the internet via packet
radio. I'm trying to get a feel for the amount of equipment
required to get started, to see if this is something I could afford
to do as a hobby. I have a fast computer, and I need a radio, TNC,
antenna, special modem (?). I am also unclear on how one becomes
connected to the net. Are there any other options I should consider
for wireless internet service before choosing Amateur Radio Packet?

Thanks alot for any information.

JO> I was refering to operation as a remote mailbox
JO> with the software provided.

AH! Sorry about that, Very true, I would like to have it with a built in mailbox
but it's better then nothing.

JO> I would like to know more details about
JO> the software you are using. I am running a
JO> dedicated XT for packet (PS/2 Model 25).
JO> I know its lame, but it is small and I got it free!
JO> (My main computer is 486/33). Anyway, I
JO> heard that JNOS and Baycomm will not work
JO> on an XT. Is this true?

Well some say it does and others say it doesn't, I'm not sure. I've ran it on a 286, but
now run it on a 386-40, and no probs. I have done some MODs to the
source driver and it seems to uses less CPU and hog less of the system.
Now if it works on a XT I have no idea, hard to find those machines any more. :)

But I have it setup so that if I have JNOS running it will send a request to my
gateway every 1hr I think and checks to see if I have any mail waiting. Now
at times what happens is if it (Gateway) receives mail and I'm on the air
it will send it direct to me. If I'm not on the air it will save al of my mail
in it's mail area and then once I do turn the radio on, it will go out and
say, 'hey ve3tos is now on air, any mail?' and I will then transfer my mail.
IT can be either normal packet mail, or internet mail.

Hugh Shane (shane@mdd.comm.mot.com) writes:

> Can anyone direct me to an on-line source for the AX.25
> specification?

I queried the TAPR e-mail file server for the first time just the other night, and the list of available files includes the following, which certainly appears to be what you're after:

File Area: packet
Directory: /pub/packet/

AX25.DOC 66266 2-01-93 66k Docs AX.25 Amateur Packet Radio
Link Layer Protocol

To retrieve this document, send e-mail to "file-request@tapr.org" with the command "GET /pub/packet/ax25.doc" in the body of the message.

The command "DIR" will retrieve a complete list of files available from the server, and the command "HELP" will retrieve a description of the complete command set supported by the server. Multiple commands may be included in a single message.

|>

One day, I actually took the mike apart to figure this out.
Two of the buttons ground the UP and DOWN lines through 100K resistors,
and the other two buttons do the same through 20K resistors. (I
may not be remembering the exact values correctly).

To find out all the details, just hook an ohmmeter from the UP/DOWN
connector pins to ground, and push the buttons.

>acceptable for automatic control data stations?? Kind of hypocritical
>wouldn't you say?

No. The problem with W1AW is that they *don't listen* before transmitting.
What channelization buys is the possibility of implementing a much more
robust method of automatically detecting other activity before transmitting.
With no channelization, there are an infinite number of center frequencies
where a signal may be. With channelization, that number is reduced to a
manageable number that can be checked, manually or automatically, before
transmitting. If interference *does* still occur because of odd propagation
effects, it will be limited to the users of that one channel, not to two
different sets of users as could happen with no standard channel spacing.

Standard channelization is the norm in all services except the amateur
service, and is even accepted there for most VHF/UHF activity. There's
a very good reason why everyone else has gone to standard channels, and
that reason is lessened mutual interference. Amateurs are being backward
in refusing to acknowledge the advantages of channelization as a tool for
interference control.

>
>Hints, references or answers are highly appreciated.

There are several workable approaches to this problem. The most
straight forward approach is to use a hetrodyne system. The modulation
is impressed on a crystal VXO at an intermediate frequency, and that
is mixed with the synthesized VCO to get the output frequency. Since
the PLL loop is only around the heterodyne oscillator, it won't subtract
the modulation.

Another approach is to use a data randomizer, or scrambler, to insure
there are no near DC components to the modulation. This is a common
approach, and the one taken in the GRAPES 56 kb RF modem.

I think you're going to have to write the low level TNC emulator
software yourself in Z80 assembler. The Baycom program is written
for the PC and won't work on the TRS-102's Z80 architecture.
Remember, the Baycom system is a total bit bang system with the
hardware being just a zero crossing detector. The USART function
is done in software, as is the AX25 protocol.

Unless I'm totally out of touch, no one has ported that software
to the TRS-100/102 series of notebooks.

Most HF forwarding is now done with compressed files, much the
way Usenet is distributed via uucp links. This saves time and
bandwidth moving the traffic.

>When I try to connect to one of these stations, I either get no
>connection at all, a connect followed by an immediate disconnect,
>or a message to the effect that "only members are allowed on this

The stations in the forwarding network don't allow outside stations
to connect. You're supposed to inject and remove traffic from the
system at your local VHF end node. Allowing random connections would
totally hose the automatic routing software.

>heard of digipeaters).

There is ragchewing on HF, but frankly, packet is ill suited to such
use. You'll find what packet ragchewers there are down with the RTTY
and AMTOR ragchew operations. AMTOR is best for the type of operating
you want to do. Put out a FEC CQ, including your selcall, and wait for
someone to link with you in ARQ mode, or link with someone calling CQ.
If you don't mind garbled print, you also might try your hand at RTTY.
Just send a string of RYRYRYRY characters to allow your signal to be
tuned, and then follow with a CQ. If you do try packet ragchewing,
remember to keep your packets short. A maximum length of 40 characters

is a good value.

QRO Telecom Provider, NY and former Soviet Union searching for
in-the-blood radio man, primarily for specification of
customized radio systems. Position would be NY with frequent
travel to former SU. (Reciprocal license, Icom-781, included!)

Requirements:

* deep background and practical on VHF/UHF, repeaters, antennas
* hands-on knowledge of equipment, alternatives and vendors

* packet, digiplexer and Internet a plus * HF antennas a plus
* microwave a plus
* cellular experience a plus
* PC skills including diagramming and presenting to staff and
customers
* good health, passport, tolerance of QRM

Company operates numerous satellite gateways and remote sites;
C/Ku experience a plus but not necessary.

Energy, initiative and ability to assimilate, organize and
communicate to multi-national staff and clients essential.
Radio Blood --- DC to light --- is essential.

Please pass the word. It's a good gig.

For a packet ragchew on 20m try 14.103MHz. Send a few unproto packets
to "CQ" perhaps 4 or 5 in a row and wait for a call. Also keep an
eye on that frequency for other "CQ" packets. There is also alot of
activity there connecting through nodes and gateways to local VHF
packet nets.

>
>I think you're going to have to write the low level TNC emulator
>software yourself in Z80 assembler.

Actually, the Tandy 100/102/200 series laptops use an 8085 cpu not a Z80,
but you would still have to write the TNC emulator as Gary says. That's
not going to be easy to do in the limited amount of RAM you have on that
machine.

>The Baycom program is written
>for the PC and won't work on the TRS-102's Z80 architecture.
>Remember, the Baycom system is a total bit bang system with the
>hardware being just a zero crossing detector. The USART function
>is done in software, as is the AX25 protocol.
>

Actually, you don't need any additional hardware if you use a TRS-102.
The Tandy 100/102/200 laptops all have built in hardware in a cassette
port that you can use to save and load your programs onto a regular
cassette tape. The internal ROM routines access the hardware via the
SOD pin using the SIM/RIM instructions on the 8085 CPU.

Essentially, the cassette audio output is fed to the CPU pin and the software
loops while looking at the pin it to see if it is still HIGH (or still LOW).
By counting the number of times the software loop was executed until the
pin changed, you can determine (roughly) the frequency of the audio tone
that was fed into the cassette port. With the cassette (or for AFSK packet)
you just need to determine which or two possible tone have been presented.
(With packet, you also need to worry about noise between packets.)
This is how the ROM "reads" the cassette tones.

If you really want to know the details, just disassemble the ROM routines.
The flag for whether or not the loop is looking for HIGH or LOW is at FF8E.
Other routines you might want to look at:

6F5B - Write a character to cassette.
6FDB - Find the frequency of the cassette port (1200 hz tone returns 35).
702A - Read a character from cassette.

(The above addresses are different for the Model 200 though.)

Also, consider the fact that you have a laptop with only 32k
(19k for the model 200 unless you also want to code bank switching)
in which you need to do the bit-banging, USART stuff, emulate a TNC and
AX.25 ... and you can't use all of that RAM for your code either. You need

some room for buffers, variables, and so on. Did I mention you need to code most of this in 8085 assembler? The built-in BASIC is just too slow to decode the packets, check for keystrokes, worry about the AX.25 timing constraints and so on.

Plus, some day you might want to save some of the stuff you see on packet. You'll need some memory left over for that too. (TRS-102 files are stored in RAM.) Impossible, no. Difficult, yes. Worth the effort??? You decide.

>Unless I'm totally out of touch, no one has ported that software
>to the TRS-100/102 series of notebooks.
>
True as far as I know. If anyone knows differently, please tell me !!
I actually considered it some time ago, but didn't have the time and
I already had a TNC. I found it easier to just plug in a TNC.
But I think it's possible to write a Baycomm emulator for those laptops.

>Gary

Chris May writes:
> I was wondering if anyone could provide me with some information
> detailing the different price/performance options available for an amateur
> radio setup capable of communicating with the internet via packet
> radio.
[stuff deleted]

The cost ratio between internet access by wire and internet access by amateur radio (for similar services) is about 1000:1 where amateur radio costs about $1000 for the service you'd get for $1 via telephone.

Maybe I exagerate, but only a bit :-)

One does not get an amateur radio license in order to save money, except in the very rarest of situations. Maybe you have a friend or spouse in Europe and you like to talk, a LOT. Or this friend is in the middle of nowhere. MAYBE then you could save money via amateur radio if you didn't mind a couple of hundred listeners to your conversations.

One chooses to become an amateur radio operator because it is "RADIO" and radio is magic, and magic is fun in and of itself. There are areas available in amateur radio that do not exist on the internet, and vice versa. For example, last week I copied packet radio data from the Space Shuttle. Was so suprised that I wasn't ready on the transmit frequency to make a connection before the shuttle was over the horizon. You don't do that on the internet. Total equipment cost $500 new, $300 or so used. Five or six minutes at 1200 baud. Of course I still have the equipment, and didn't buy it expressly for the purpose of talking to the space shuttle, its just my normal packet station.

Locally we can get unlimited dial-up access to the internet for $30/month at 28.8k bps. For amateur radio to access the wired internet there has to be a connection somewhere on the radio net, and somebody has to pay for it. Furthermore the content carried on the internet is not regulated and monitored the way amateur radio is. Amateur radio has strict non-commercial and decency regulations. Free speech is not a right on amateur radio.

I routinely post Ham-Digital Digest on the local PBBS, but not before I review it and delete advertisements for "Thigh Creame" and such.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I picked up a couple of business radios in a swap of an HT not too long ago. I was interested in converting these to work on the ham VHF bands. (I was told that they were 150Mhz rigs) Well, surprise, surprise... They are 450 MHz rigs.

Anyway, I am first interested in the best place to get crystals to operate in the 440 MHz band. What formula do I use to get the operating frequency? (Or will the crystal manufacturer be familiar with these radios) Is it necessary or preferable to do any tuning of the circuits in these radios and if so how?

Lastly, if anyone is familiar with these radios and can save me some time in figuring out the SP/MIC pinout for the speaker mike, as I plan on using these to run some fixed packet operation at home.

Thanks...

swood

: The cost ratio between internet access by wire and internet access by amateur
: radio (for similar services) is about 1000:1 where amateur radio costs about
: $1000 for the service you'd get for $1 via telephone.

: Maybe I exagerate, but only a bit :-)

: One does not get an amateur radio license in order to save money, except in
: the very rarest of situations.

Just because you haven't thought of a way to save money with amateur radio,
doesn't mean I can't think of some.

: One chooses to become an amateur radio operator because it is "RADIO" and
: radio is magic, and magic is fun in and of itself. There are areas available
: in amateur radio that do not exist on the internet, and vice versa. For

I never said I was trying to save money over wired internet, I just said I
wanted to know about the price/performance of packet setups.

I'll find all this out eventually on my own, as the companys who make
the stuff generally want to sell it. It's nice to know that this newsgroup
is such a great resource for newcomers to the field.

Post a question in comp.os.linux.help and I bet you get an answer.
Not here.

Here's a little newer version...

AMPRNet IP address coordinators as of 11 July 1994

Corrections and updates to brian@ucsd.edu.

Note: the people listed here have volunteered to issue IP addresses for
their areas. They are not paid to do this service; please understand
that they are perfectly at ease to deal with coordination responses at
a lower priority than the things that matter more, such as job and
family. Please be patient when requesting an address.

:
: Don't have any info on the FAQ, but you can get THE LIST by ftp from
: ucsd.edu. Last I got (7/1/94) was 600k. Sorry, I don't remember the file
: name, but it is pretty blatent when you see it.

Actually, the correct site is now 'ftp.ucsd.edu', and the files you are
looking for are in the /hamradio directory, all starting with 'ampr'. That
is the domain name server file for the ampr.org name space. For a more
specific place to look for info on amateur TCP/IP, subscribe to the
'tcp-group' mailing list. Sending mail to 'listserv@ucsd.edu' with the word
'help' in the text of the message should get you some further info on how to
use the subscription robot.

73,

Bob

Karl J. Vesterling N2VQM (kjv@exuco1.exucom.com) wrote:

: What this means folks is that when doing a real Telnet session
: a packet is transmitted for every character. Un-like JNOS, or any
: other NOS variant which transmits a packet for every 200 characters or
: when newline/CR is pressed.

: Single character IO is quite tolerable at 9600bps.

Of course, you could put your telnet client in line mode, so it then works like Nos. No delays that way. Nos can handle this, as noted by the shift in operations (no echo) when entering your password on a login.

: Now that single character IO is possible, there is one thing
: (at least) that we must take note of.

: Use the same strategy in the NOS TCP implementation, but make
: the single character IO (telnet/rlogin) get through before the other
: packets do. This makes it possible to have several FTP or (batch)
: transfers taking place while someone is doing something else w/
: telnet.

Probably not needed when using line mode.

: We seriously have to consider these facts because when we get
: into limited bandwidth (6Khz or so) we're pushing the boundaries a
: bit, and it should be treated the same as a phone connection, but only
: half the speed. (1/2 duplex remember.)

: I just wish I could get programs like talk, and IRC on packet.

: Now, would you listen to me if I told you that this can be
: done for under $400.00

: Thought you might...

: TEKK Incorporated
: 228 NW. Parkway
: Kansas City, MO 64150

: (816) 746-1098

: Inquire about the TEKK Micro. It's $90.00 You can request
: crystals for the radio. We in Buffalo Decided on 441.050. Ask for a
: service manual when you order it. (They don't send any paperwork, not
: even pinouts! Although a BNC connector is rather obvious, you may
: stumble when trying to trace back the DB9 connector.) If you decided
: on the TEKK Mini, before you try and do anything with it, remove

: Capacitor C18. It's SMT, so be sure to have a fine soldering iron and
: no coffee that morning.

Also, TEKK will swap out MINI's for those who got them by mistake. The Mini rolls off the receive audio frequency response - that's why the capacitor has to be removed. It also modifies the transmit passband and implements deviation limiting. Unfortunatly the deviation limiting is set for 5 kHz, not 3 kHz that is manditory for normal 9600 bps operations. I've also had some reports from local hams that TEKK has been modifying their pricing. Specifying you saw the ad in QST will probably get you the best price. They are now charging for crystals, which were included in the purchase price 3 months ago.

: CAUTION!!! Do not run the radio at more the 12.0V until you're
: sure I'm not kidding. CAUTION!!!

: Next, get an MFJ TNC, (1270B Personally) about $140.00, and
: the MFJ 9600 Modem. Another $100.00

Or an PK-96 or a DRSI DPK-96 and no modem installation - also have heard that Kantronics has new one out (KPC-1296?) that is ready to go out of the box. If you don't already have a TNC that can accept an add-in modem, it's no longer cost effective to buy a TNC and a modem as seperate items. Several locals have gotten PK-96's and had no problems getting them up and running with TEKK's and some of the other known good 9k6 radios.

PK-96's are retailing at $200 +- $10-15 (list is higher, of course). I have not seen or heard pricing on Kantronics late offering.

: Install the modem. (READ THE MANUAL FIRST! Believe me,
: they're "Instructions", not "distructions"!)

From the comments and poor reliability of others in the area who have worked with many different tnc and modem combinations, I would not reccomend the MFJ documentation.

: Coax, and an Antenna are equally as important. Get the low loss
: coax, and a nice antenna, another $60.00 should suffice. I have the
: UHF IsoPole.

Beams are reccomended to reduce multipath, but require a bit-regenerating repeater in the area - more later

: That is, unless you do this workaround. Take two Ethernet
: cards, or two serial cards and create a network connection for
: Windows, and one for JNOS. Either over Ethernet, or a SLIP/PPP link.

: Problem is that you need to figure out how to do this because
: usually both programs have to run at the same time. Okay, so you have
: Windows fire off JNOS, but how does the DOS Networking software
: connect to something that isn't there yet because Windows isn't
: running?

: Well, simple logic will tell you the cheapest way out is a PC,
: floppy, Monochrome Monitor, and an Ethernet Card, or serial port. Done deal,
: functional, and cheap.

: (Hey, I know you all think I'm nuts, but seriously, this would
: work!)

Works for me - have 4 radio ports running on a 2M 386/DX16 box under jnos.
It will migrate to a better machine probably under linux when the mood and
funds are available. Also has an ethernet card to talk to the linux box
(386SX/16 hotrodded to 22.5 MHz with 5M main + 3M ISA memory) and the
Windoze/DOS box. I just got Minuet and had it running under Dos in about 10
minutes, talking through the router to other local IPers. Of course, all
the hard work was already done in the router, and as the local IP address
admin, getting new addresses issued is pretty quick...

: Now the problem is routing TCP/IP packets off of Packet, and
: onto the network connection to your PC. (Oh, you're network
: coordinator is going to need to buy stock in Malox for this one!)

Not this one - I'm one of about a dozen here in the Seattle area that has a
router on the air with other machines SLIPed or EtherNetted to it.

: Now, we need a way to do bit regeneration (IE, very fast
: digipeater) without bothering routing.

: Two TEKK Micro's, and 1 9600bps modem will do nicely for this.
: Input frequency, output frequency, it's half duplex, and goes both
: ways. The TEKK Micro's have a 3ms keyup to stable time. Put this
: gadget on a nice repeater tower near you. And you divide the network
: distance. What you do is take the frequency of one area, and
: bit-regenerate it on another.

: IE, RX -> TX, and TX -> RX. No TNC needed. All you need the
: modem to do is regenerate the bits. Course the frequencies have to be
: different, but so what.

: And we increase the chances for a collision by a little bit,
: but having this device installed fixes things a lot more.

A better solution is to actually build up a full-blown repeater. Without
the cavities or a >lot< of antenna seperation the overload suceptable
receiver in the TEKK will get desensitized and your system will bounce up
and down as the received signal comes and goes. We've seen this happen when
trying to use some of the old commercial mobile telephone (IMTS) radios with
their internal duplexers. There is just not enough isolation there to
prevent desense - typically about 10 dB of it. As for a bit-regenerator,
TAPR has a modem that has provisions for the bit-regen right on the PCB.
Exact prices are not in memory, but $70 for the modem, and $20 for the clock
and bit-regen options are about right. We have 4 systems in the area now
using this hardware, and RF path problems aside, those systems work very
well. One has been up for close to 2 years, with no maintainence required.
We used a GE Mastr II mobile for the 2M system and one of the 440 systems.
the other two 440 systems are using Motorola IMTS radios (Pulsar?).

: The only thing you will have to do is set your TXDELAY by
: approximately .0096/sec + .0006 (9600bps + 3ms*2 radios stabilize
: time) = .0102/sec. So we'll settle for 2 hundreths of a second
: TXDELAY. Not bad at all if you ask me. Some of you may be asking why
: I'm using 9600bps as a value, and I figure that the difference between the time
: where the TNC get's the digital information and actually starts to
: make it analog (modulate it), that it's going to be about that long.
: (I could be wrong, but then again, I'm talking about pushing the
: envelope here.)

TXDelay through a bit-regen system will have to be a little longer, because
it has to recogize the incoming data before it can key up the transmitter.
Also, the receiving TNC has to get syncrhonized on the incoming data after
the repeater comes up and stablizes (about 7 mS on our modified commercial
rig). Since a data randomizer is part of the modem specification, this adds
to the minimum TXDelay you can use, even on a simplex path. Still is better
than 1200!

: If anyone has any questions, please feel free to E-Mail me.

Or me...

73, Bob
